Chapter 1

GNU Internationalized Domain Name Library

1.1 Introduction

GNU Libidn is an implementation of the Stringprep, Punycode and IDNA specifications defined by the IETF Internationalized Domain Names (IDN) working group, used for internationalized domain names. The package is available under the GNU Lesser General Public License.

The library contains a generic Stringprep implementation that does Unicode 3.2 NFKC normalization, mapping and prohibition of characters, and bidirectional character handling. Profiles for Nameprep, i-SCSI, SASL and XMPP are included. Punycode and ASCII Compatible Encoding (ACE) via IDNA are supported. A mechanism to define Top-Level Domain (TLD) specific validation tables, and to compare strings against those tables, is included. Default tables for some TLDs are also included.

The Stringprep API consists of two main functions, one for converting data from the system's native representation into UTF-8, and one function to perform the Stringprep processing. Adding a new Stringprep profile for your application within the API is straightforward. The Punycode API consists of one encoding function and one decoding function. The IDNA API consists of the ToASCII and ToUnicode functions, as well as an high-level interface for converting entire domain names to and from the ACE encoded form. The TLD API consists of one set of functions to extract the TLD name from a domain string, one set of functions to locate the proper TLD table to use based on the TLD name, and core functions to validate a string against a TLD table, and some utility wrappers to perform all the steps in one call.

The library is used by, e.g., GNU SASL and Shishi to process user names and passwords. Libidn can be built into GNU Libc to enable a new system-wide getaddrinfo() flag for IDN processing.

Libidn is developed for the GNU/Linux system, but runs on over 20 Unix platforms (including Solaris, IRIX, AIX, and Tru64) and Windows. Libidn is written in C and (parts of) the API is accessible from C, C++, Emacs Lisp, Python and Java.

5.7.1　Define Documentation

5.7.1.1　#define DOTP(c)

Value:

```
((c) == 0x002E || (c) == 0x3002 ||      \
                (c) == 0xFF0E || (c) == 0xFF61)
```

Definition at line 33 of file idna.c.

Referenced by idna_to_ascii_4z(), idna_to_unicode_4z4z(), and tld_get_4().

5.7.2　Function Documentation

5.7.2.1　int idna_to_ascii_4i (const uint32_t ∗ *in*, size_t *inlen*, char ∗ *out*, int *flags*)

idna_to_ascii_4i - convert Unicode domain name label to text

Parameters:

　　　in　input array with unicode code points.

　　　inlen　length of input array with unicode code points.

out output zero terminated string that must have room for at least 63 characters plus the terminating zero.

flags an Idna_flags value, e.g., IDNA_ALLOW_UNASSIGNED or IDNA_USE_STD3_ASCII_-RULES.

The ToASCII operation takes a sequence of Unicode code points that make up one label and transforms it into a sequence of code points in the ASCII range (0..7F). If ToASCII succeeds, the original sequence and the resulting sequence are equivalent labels.

It is important to note that the ToASCII operation can fail. ToASCII fails if any step of it fails. If any step of the ToASCII operation fails on any label in a domain name, that domain name MUST NOT be used as an internationalized domain name. The method for deadling with this failure is application-specific.

The inputs to ToASCII are a sequence of code points, the AllowUnassigned flag, and the Use-STD3ASCIIRules flag. The output of ToASCII is either a sequence of ASCII code points or a failure condition.

ToASCII never alters a sequence of code points that are all in the ASCII range to begin with (although it could fail). Applying the ToASCII operation multiple times has exactly the same effect as applying it just once.

Return value: Returns 0 on success, or an Idna_rc error code.

Definition at line 70 of file idna.c.

References IDNA_ACE_PREFIX, IDNA_ALLOW_UNASSIGNED, IDNA_CONTAINS_ACE_PREFIX, IDNA_CONTAINS_MINUS, IDNA_CONTAINS_NON_LDH, IDNA_INVALID_LENGTH, IDNA_-MALLOC_ERROR, IDNA_PUNYCODE_ERROR, IDNA_STRINGPREP_ERROR, IDNA_SUCCESS, IDNA_USE_STD3_ASCII_RULES, punycode_encode(), PUNYCODE_SUCCESS, stringprep_-nameprep, stringprep_nameprep_no_unassigned, STRINGPREP_OK, STRINGPREP_TOO_SMALL_-BUFFER, stringprep_ucs4_to_utf8(), stringprep_utf8_to_ucs4(), and uint32_t.

Referenced by idna_to_ascii_4z().

5.7.2.2 int idna_to_ascii_4z (const uint32_t ∗ *input*, char ∗∗ *output*, int *flags*)

idna_to_ascii_4z - convert Unicode domain name label to text

Parameters:

input zero terminated input Unicode string.

output pointer to newly allocated output string.

flags an Idna_flags value, e.g., IDNA_ALLOW_UNASSIGNED or IDNA_USE_STD3_ASCII_-RULES.

Convert UCS-4 domain name to ASCII string. The domain name may contain several labels, separated by dots. The output buffer must be deallocated by the caller.

Return value: Returns IDNA_SUCCESS on success, or error code.

Definition at line 455 of file idna.c.

References DOTP, IDNA_MALLOC_ERROR, IDNA_SUCCESS, idna_to_ascii_4i(), and uint32_t.

Referenced by idna_to_ascii_8z().

5.7.2.3 int idna_to_ascii_8z (const char ∗ *input*, char ∗∗ *output*, int *flags*)

idna_to_ascii_8z - convert Unicode domain name label to text

Parameters:

    input zero terminated input UTF-8 string.

    output pointer to newly allocated output string.

    flags an Idna_flags value, e.g., IDNA_ALLOW_UNASSIGNED or IDNA_USE_STD3_ASCII_-
        RULES.

Convert UTF-8 domain name to ASCII string. The domain name may contain several labels, separated by dots. The output buffer must be deallocated by the caller.

Return value: Returns IDNA_SUCCESS on success, or error code.

Definition at line 551 of file idna.c.

References IDNA_ICONV_ERROR, idna_to_ascii_4z(), stringprep_utf8_to_ucs4(), and uint32_t.

Referenced by idna_to_ascii_lz().

5.7.2.4 int idna_to_ascii_lz (const char ∗ *input*, char ∗∗ *output*, int *flags*)

idna_to_ascii_lz - convert Unicode domain name label to text

Parameters:

    input zero terminated input string encoded in the current locale's character set.

    output pointer to newly allocated output string.

    flags an Idna_flags value, e.g., IDNA_ALLOW_UNASSIGNED or IDNA_USE_STD3_ASCII_-
        RULES.

Convert domain name in the locale's encoding to ASCII string. The domain name may contain several labels, separated by dots. The output buffer must be deallocated by the caller.

Return value: Returns IDNA_SUCCESS on success, or error code.

Definition at line 584 of file idna.c.

References IDNA_ICONV_ERROR, idna_to_ascii_8z(), and stringprep_locale_to_utf8().

5.7.2.5 int idna_to_unicode_44i (const uint32_t ∗ *in*, size_t *inlen*, uint32_t ∗ *out*, size_t ∗ *outlen*, int *flags*)

idna_to_unicode_44i - convert domain name label to Unicode

Parameters:

    in input array with unicode code points.

    inlen length of input array with unicode code points.

    out output array with unicode code points.

    outlen on input, maximum size of output array with unicode code points, on exit, actual size of output
        array with unicode code points.

    flags an Idna_flags value, e.g., IDNA_ALLOW_UNASSIGNED or IDNA_USE_STD3_ASCII_-
        RULES.

The ToUnicode operation takes a sequence of Unicode code points that make up one label and returns a sequence of Unicode code points. If the input sequence is a label in ACE form, then the result is an

equivalent internationalized label that is not in ACE form, otherwise the original sequence is returned unaltered.

ToUnicode never fails. If any step fails, then the original input sequence is returned immediately in that step.

The Punycode decoder can never output more code points than it inputs, but Nameprep can, and therefore ToUnicode can. Note that the number of octets needed to represent a sequence of code points depends on the particular character encoding used.

The inputs to ToUnicode are a sequence of code points, the AllowUnassigned flag, and the Use-STD3ASCIIRules flag. The output of ToUnicode is always a sequence of Unicode code points.

Return value: Returns Idna_rc error condition, but it must only be used for debugging purposes. The output buffer is always guaranteed to contain the correct data according to the specification (sans malloc induced errors). NB! This means that you normally ignore the return code from this function, as checking it means breaking the standard.

5.7.2.6 int idna_to_unicode_4z4z (const uint32_t ∗ *input*, uint32_t ∗∗ *output*, int *flags*)

idna_to_unicode_4z4z - convert domain name label to Unicode

Parameters:

> *input* zero-terminated Unicode string.
>
> *output* pointer to newly allocated output Unicode string.
>
> *flags* an Idna_flags value, e.g., IDNA_ALLOW_UNASSIGNED or IDNA_USE_STD3_ASCII_-RULES.

Convert possibly ACE encoded domain name in UCS-4 format into a UCS-4 string. The domain name may contain several labels, separated by dots. The output buffer must be deallocated by the caller.

Return value: Returns IDNA_SUCCESS on success, or error code.

Definition at line 615 of file idna.c.

References DOTP, IDNA_MALLOC_ERROR, IDNA_SUCCESS, idna_to_unicode_44i(), and uint32_t.

Referenced by idna_to_unicode_8z4z().

5.7.2.7 int idna_to_unicode_8z4z (const char ∗ *input*, uint32_t ∗∗ *output*, int *flags*)

idna_to_unicode_8z4z - convert domain name label to Unicode

Parameters:

> *input* zero-terminated UTF-8 string.
>
> *output* pointer to newly allocated output Unicode string.
>
> *flags* an Idna_flags value, e.g., IDNA_ALLOW_UNASSIGNED or IDNA_USE_STD3_ASCII_-RULES.

Convert possibly ACE encoded domain name in UTF-8 format into a UCS-4 string. The domain name may contain several labels, separated by dots. The output buffer must be deallocated by the caller.

Return value: Returns IDNA_SUCCESS on success, or error code.

Definition at line 691 of file idna.c.

References IDNA_ICONV_ERROR, idna_to_unicode_4z4z(), stringprep_utf8_to_ucs4(), and uint32_t.

Referenced by idna_to_unicode_8z8z().

5.7.2.8   int idna_to_unicode_8z8z (const char ∗ *input*, char ∗∗ *output*, int *flags*)

idna_to_unicode_8z8z - convert domain name label to Unicode

Parameters:

> *input* zero-terminated UTF-8 string.
>
> *output* pointer to newly allocated output UTF-8 string.
>
> *flags* an Idna_flags value, e.g., IDNA_ALLOW_UNASSIGNED or IDNA_USE_STD3_ASCII_-
> RULES.

Convert possibly ACE encoded domain name in UTF-8 format into a UTF-8 string. The domain name may contain several labels, separated by dots. The output buffer must be deallocated by the caller.

Return value: Returns IDNA_SUCCESS on success, or error code.

Definition at line 722 of file idna.c.

References IDNA_ICONV_ERROR, idna_to_unicode_8z4z(), stringprep_ucs4_to_utf8(), and uint32_t.

Referenced by idna_to_unicode_8zlz().

5.7.2.9   int idna_to_unicode_8zlz (const char ∗ *input*, char ∗∗ *output*, int *flags*)

idna_to_unicode_8zlz - convert domain name label to Unicode

Parameters:

> *input* zero-terminated UTF-8 string.
>
> *output* pointer to newly allocated output string encoded in the current locale's character set.
>
> *flags* an Idna_flags value, e.g., IDNA_ALLOW_UNASSIGNED or IDNA_USE_STD3_ASCII_-
> RULES.

Convert possibly ACE encoded domain name in UTF-8 format into a string encoded in the current locale's character set. The domain name may contain several labels, separated by dots. The output buffer must be deallocated by the caller.

Return value: Returns IDNA_SUCCESS on success, or error code.

Definition at line 753 of file idna.c.

References IDNA_ICONV_ERROR, idna_to_unicode_8z8z(), and stringprep_utf8_to_locale().

Referenced by idna_to_unicode_lzlz().

5.7.2.10   int idna_to_unicode_lzlz (const char ∗ *input*, char ∗∗ *output*, int *flags*)

idna_to_unicode_lzlz - convert domain name label to Unicode

Parameters:

> ***input*** zero-terminated string encoded in the current locale's character set.
>
> ***output*** pointer to newly allocated output string encoded in the current locale's character set.
>
> ***flags*** an Idna_flags value, e.g., IDNA_ALLOW_UNASSIGNED or IDNA_USE_STD3_ASCII_-RULES.

Convert possibly ACE encoded domain name in the locale's character set into a string encoded in the current locale's character set. The domain name may contain several labels, separated by dots. The output buffer must be deallocated by the caller.

Return value: Returns IDNA_SUCCESS on success, or error code.

Definition at line 785 of file idna.c.

References IDNA_ICONV_ERROR, idna_to_unicode_8zlz(), and stringprep_locale_to_utf8().

5.8.3 Function Documentation

5.8.3.1 const char∗ idna_strerror (Idna_rc *rc*)

idna_strerror - return string describing idna error code

Parameters:

> *rc* an Idna_rc return code.

Convert a return code integer to a text string. This string can be used to output a diagnostic message to the user.

IDNA_SUCCESS: Successful operation. This value is guaranteed to always be zero, the remaining ones are only guaranteed to hold non-zero values, for logical comparison purposes. IDNA_STRINGPREP_-ERROR: Error during string preparation. IDNA_PUNYCODE_ERROR: Error during punycode operation. IDNA_CONTAINS_NON_LDH: For IDNA_USE_STD3_ASCII_RULES, indicate that the string contains non-LDH ASCII characters. IDNA_CONTAINS_MINUS: For IDNA_USE_STD3_ASCII_RULES, indicate that the string contains a leading or trailing hyphen-minus (U+002D). IDNA_INVALID_LENGTH:

The final output string is not within the (inclusive) range 1 to 63 characters. IDNA_NO_ACE_PREFIX: The string does not contain the ACE prefix (for ToUnicode). IDNA_ROUNDTRIP_VERIFY_ERROR: The ToASCII operation on output string does not equal the input. IDNA_CONTAINS_ACE_PREFIX: The input contains the ACE prefix (for ToASCII). IDNA_ICONV_ERROR: Could not convert string in locale encoding. IDNA_MALLOC_ERROR: Could not allocate buffer (this is typically a fatal error). IDNA_DLOPEN_ERROR: Could not dlopen the libcidn DSO (only used internally in libc).

Return value: Returns a pointer to a statically allocated string containing a description of the error with the return code .

Definition at line 65 of file strerror-idna.c.

References _, IDNA_CONTAINS_ACE_PREFIX, IDNA_CONTAINS_MINUS, IDNA_CONTAINS_-NON_LDH, IDNA_DLOPEN_ERROR, IDNA_ICONV_ERROR, IDNA_INVALID_LENGTH, IDNA_-MALLOC_ERROR, IDNA_NO_ACE_PREFIX, IDNA_PUNYCODE_ERROR, IDNA_ROUNDTRIP_-VERIFY_ERROR, IDNA_STRINGPREP_ERROR, and IDNA_SUCCESS.

5.8.3.2 int idna_to_ascii_4i (const uint32_t ∗ *in*, size_t *inlen*, char ∗ *out*, int *flags*)

idna_to_ascii_4i - convert Unicode domain name label to text

Parameters:

> *in* input array with unicode code points.
>
> *inlen* length of input array with unicode code points.
>
> *out* output zero terminated string that must have room for at least 63 characters plus the terminating zero.
>
> *flags* an Idna_flags value, e.g., IDNA_ALLOW_UNASSIGNED or IDNA_USE_STD3_ASCII_-RULES.

The ToASCII operation takes a sequence of Unicode code points that make up one label and transforms it into a sequence of code points in the ASCII range (0..7F). If ToASCII succeeds, the original sequence and the resulting sequence are equivalent labels.

It is important to note that the ToASCII operation can fail. ToASCII fails if any step of it fails. If any step of the ToASCII operation fails on any label in a domain name, that domain name MUST NOT be used as an internationalized domain name. The method for deadling with this failure is application-specific.

The inputs to ToASCII are a sequence of code points, the AllowUnassigned flag, and the Use-STD3ASCIIRules flag. The output of ToASCII is either a sequence of ASCII code points or a failure condition.

ToASCII never alters a sequence of code points that are all in the ASCII range to begin with (although it could fail). Applying the ToASCII operation multiple times has exactly the same effect as applying it just once.

Return value: Returns 0 on success, or an Idna_rc error code.

Definition at line 70 of file idna.c.

References IDNA_ACE_PREFIX, IDNA_ALLOW_UNASSIGNED, IDNA_CONTAINS_ACE_PREFIX, IDNA_CONTAINS_MINUS, IDNA_CONTAINS_NON_LDH, IDNA_INVALID_LENGTH, IDNA_-MALLOC_ERROR, IDNA_PUNYCODE_ERROR, IDNA_STRINGPREP_ERROR, IDNA_SUCCESS, IDNA_USE_STD3_ASCII_RULES, punycode_encode(), PUNYCODE_SUCCESS, stringprep_-nameprep, stringprep_nameprep_no_unassigned, STRINGPREP_OK, STRINGPREP_TOO_SMALL_-BUFFER, stringprep_ucs4_to_utf8(), stringprep_utf8_to_ucs4(), and uint32_t.

5.8.3.3   int idna_to_ascii_4z (const uint32_t ∗ *input*, char ∗∗ *output*, int *flags*)

idna_to_ascii_4z - convert Unicode domain name label to text

Parameters:

> *input* zero terminated input Unicode string.
>
> *output* pointer to newly allocated output string.
>
> *flags* an Idna_flags value, e.g., IDNA_ALLOW_UNASSIGNED or IDNA_USE_STD3_ASCII_-
> RULES.

Convert UCS-4 domain name to ASCII string. The domain name may contain several labels, separated by dots. The output buffer must be deallocated by the caller.

Return value: Returns IDNA_SUCCESS on success, or error code.

Definition at line 455 of file idna.c.

References DOTP, IDNA_MALLOC_ERROR, IDNA_SUCCESS, idna_to_ascii_4i(), and uint32_t.

Referenced by idna_to_ascii_8z().

5.8.3.4   int idna_to_ascii_8z (const char ∗ *input*, char ∗∗ *output*, int *flags*)

idna_to_ascii_8z - convert Unicode domain name label to text

Parameters:

> *input* zero terminated input UTF-8 string.
>
> *output* pointer to newly allocated output string.
>
> *flags* an Idna_flags value, e.g., IDNA_ALLOW_UNASSIGNED or IDNA_USE_STD3_ASCII_-
> RULES.

Convert UTF-8 domain name to ASCII string. The domain name may contain several labels, separated by dots. The output buffer must be deallocated by the caller.

Return value: Returns IDNA_SUCCESS on success, or error code.

Definition at line 551 of file idna.c.

5.8.3.5   int idna_to_ascii_lz (const char ∗ *input*, char ∗∗ *output*, int *flags*)

idna_to_ascii_lz - convert Unicode domain name label to text

Parameters:

> *input* zero terminated input string encoded in the current locale's character set.
>
> *output* pointer to newly allocated output string.
>
> *flags* an Idna_flags value, e.g., IDNA_ALLOW_UNASSIGNED or IDNA_USE_STD3_ASCII_-
> RULES.

Convert domain name in the locale's encoding to ASCII string. The domain name may contain several labels, separated by dots. The output buffer must be deallocated by the caller.

Return value: Returns IDNA_SUCCESS on success, or error code.

Definition at line 584 of file idna.c.

References IDNA_ICONV_ERROR, idna_to_ascii_8z(), and stringprep_locale_to_utf8().

5.8.3.6 int idna_to_unicode_44i (const uint32_t ∗ *in*, size_t *inlen*, uint32_t ∗ *out*, size_t ∗ *outlen*, int *flags*)

idna_to_unicode_44i - convert domain name label to Unicode

Parameters:

> *in* input array with unicode code points.
>
> *inlen* length of input array with unicode code points.
>
> *out* output array with unicode code points.
>
> *outlen* on input, maximum size of output array with unicode code points, on exit, actual size of output array with unicode code points.
>
> *flags* an Idna_flags value, e.g., IDNA_ALLOW_UNASSIGNED or IDNA_USE_STD3_ASCII_-RULES.

The ToUnicode operation takes a sequence of Unicode code points that make up one label and returns a sequence of Unicode code points. If the input sequence is a label in ACE form, then the result is an equivalent internationalized label that is not in ACE form, otherwise the original sequence is returned unaltered.

ToUnicode never fails. If any step fails, then the original input sequence is returned immediately in that step.

The Punycode decoder can never output more code points than it inputs, but Nameprep can, and therefore ToUnicode can. Note that the number of octets needed to represent a sequence of code points depends on the particular character encoding used.

The inputs to ToUnicode are a sequence of code points, the AllowUnassigned flag, and the Use-STD3ASCIIRules flag. The output of ToUnicode is always a sequence of Unicode code points.

Return value: Returns Idna_rc error condition, but it must only be used for debugging purposes. The output buffer is always guaranteed to contain the correct data according to the specification (sans malloc induced errors). NB! This means that you normally ignore the return code from this function, as checking it means breaking the standard.

5.9.3   Function Documentation

5.9.3.1   uint32_t∗ stringprep_ucs4_nfkc_normalize (uint32_t ∗ *str*, ssize_t *len*)

stringprep_ucs4_nfkc_normalize - normalize Unicode string

Parameters:

> *str* a Unicode string.
>
> *len* length of array, or -1 if is nul-terminated.

Converts UCS4 string into UTF-8 and runs stringprep_utf8_nfkc_normalize().

Return value: a newly allocated Unicode string, that is the NFKC normalized form of .

Definition at line 1048 of file nfkc.c.

References G_NORMALIZE_NFKC, stringprep_ucs4_to_utf8(), and uint32_t.

Referenced by stringprep_4i().

5.9.3.2 char∗ stringprep_ucs4_to_utf8 (const uint32_t ∗ *str*, ssize_t *len*, size_t ∗ *items_read*, size_t ∗ *items_written*)

stringprep_ucs4_to_utf8 - convert UCS-4 string to UTF-8

Parameters:

    str a UCS-4 encoded string

    len the maximum length of to use. If < 0, then the string is terminated with a 0 character.

    items_read location to store number of characters read read, or NULL.

    items_written location to store number of bytes written or NULL. The value here stored does not include the trailing 0 byte.

Convert a string from a 32-bit fixed width representation as UCS-4. to UTF-8. The result will be terminated with a 0 byte.

Return value: a pointer to a newly allocated UTF-8 string. This value must be freed with free(). If an error occurs, NULL will be returned and set.

Definition at line 1001 of file nfkc.c.

References glong.

Referenced by idna_to_ascii_4i(), idna_to_unicode_44i(), idna_to_unicode_8z8z(), stringprep(), and stringprep_ucs4_nfkc_normalize().

5.9.3.3 int stringprep_unichar_to_utf8 (uint32_t *c*, char ∗ *outbuf*)

stringprep_unichar_to_utf8 - convert Unicode code point to UTF-8

Parameters:

    c a ISO10646 character code

    outbuf output buffer, must have at least 6 bytes of space. If NULL, the length will be computed and returned and nothing will be written to .

Converts a single character to UTF-8.

Return value: number of bytes written.

Definition at line 956 of file nfkc.c.

5.9.3.4 char∗ stringprep_utf8_nfkc_normalize (const char ∗ *str*, ssize_t *len*)

stringprep_utf8_nfkc_normalize - normalize Unicode string

Parameters:

  str a UTF-8 encoded string.

  len length of , in bytes, or -1 if is nul-terminated.

Converts a string into canonical form, standardizing such issues as whether a character with an accent is represented as a base character and combining accent or as a single precomposed character.

The normalization mode is NFKC (ALL COMPOSE). It standardizes differences that do not affect the text content, such as the above-mentioned accent representation. It standardizes the "compatibility" characters in Unicode, such as SUPERSCRIPT THREE to the standard forms (in this case DIGIT THREE). Formatting information may be lost but for most text operations such characters should be considered the same. It returns a result with composed forms rather than a maximally decomposed form.

Return value: a newly allocated string, that is the NFKC normalized form of .

Definition at line 1031 of file nfkc.c.

References G_NORMALIZE_NFKC.

5.9.3.5 uint32_t∗ stringprep_utf8_to_ucs4 (const char ∗ *str*, ssize_t *len*, size_t ∗ *items_written*)

stringprep_utf8_to_ucs4 - convert UTF-8 string to UCS-4

Parameters:

  str a UTF-8 encoded string

  len the maximum length of to use. If < 0, then the string is nul-terminated.

  items_written location to store the number of characters in the result, or NULL.

Convert a string from UTF-8 to a 32-bit fixed width representation as UCS-4, assuming valid UTF-8 input. This function does no error checking on the input.

Return value: a pointer to a newly allocated UCS-4 string. This value must be freed with free().

Definition at line 977 of file nfkc.c.

References glong.

Referenced by idna_to_ascii_4i(), idna_to_ascii_8z(), idna_to_unicode_8z4z(), pr29_8z(), stringprep(), and tld_check_8z().

5.9.3.6 uint32_t stringprep_utf8_to_unichar (const char ∗ *p*)

stringprep_utf8_to_unichar - convert UTF-8 to Unicode code point

Parameters:

  p a pointer to Unicode character encoded as UTF-8

Converts a sequence of bytes encoded as UTF-8 to a Unicode character. If `does` not point to a valid UTF-8 encoded character, results are undefined.

Return value: the resulting character.

Definition at line 939 of file nfkc.c.

Functions

- int pr29_4 (const uint32_t ∗in, size_t len)
- int pr29_4z (const uint32_t ∗in)
- int pr29_8z (const char ∗in)

5.10.1 Function Documentation

5.10.1.1 int pr29_4 (const uint32_t ∗ *in*, size_t *len*)

pr29_4 - check if input trigger Unicode normalization bugs

Parameters:

> *in* input array with unicode code points.
>
> *len* length of input array with unicode code points.

Check the input to see if it may be normalized into different strings by different NFKC implementations, due to an anomaly in the NFKC specifications.

Return value: Returns the Pr29_rc value PR29_SUCCESS on success, and PR29_PROBLEM if the input sequence is a "problem sequence" (i.e., may be normalized into different strings by different implementations).

Definition at line 1237 of file pr29.c.

References PR29_PROBLEM, and PR29_SUCCESS.

Referenced by pr29_4z().

5.10.1.2 int pr29_4z (const uint32_t ∗ *in*)

pr29_4z - check if input trigger Unicode normalization bugs

Parameters:

> *in* zero terminated array of Unicode code points.

Check the input to see if it may be normalized into different strings by different NFKC implementations, due to an anomaly in the NFKC specifications.

Return value: Returns the Pr29_rc value PR29_SUCCESS on success, and PR29_PROBLEM if the input sequence is a "problem sequence" (i.e., may be normalized into different strings by different implementations).

Definition at line 1278 of file pr29.c.

References pr29_4().

Referenced by pr29_8z().

5.10.1.3   int pr29_8z (const char ∗ *in*)

pr29_8z - check if input trigger Unicode normalization bugs

Parameters:

> *in* zero terminated input UTF-8 string.

Check the input to see if it may be normalized into different strings by different NFKC implementations, due to an anomaly in the NFKC specifications.

Return value: Returns the Pr29_rc value PR29_SUCCESS on success, and PR29_PROBLEM if the input sequence is a "problem sequence" (i.e., may be normalized into different strings by different implementations), or PR29_STRINGPREP_ERROR if there was a problem converting the string from UTF-8 to UCS-4.

Definition at line 1303 of file pr29.c.

References pr29_4z(), PR29_STRINGPREP_ERROR, stringprep_utf8_to_ucs4(), and uint32_t.

5.11.2 Function Documentation

5.11.2.1 int pr29_4 (const uint32_t ∗ *in*, size_t *len*)

pr29_4 - check if input trigger Unicode normalization bugs

Parameters:

    in input array with unicode code points.

    len length of input array with unicode code points.

Check the input to see if it may be normalized into different strings by different NFKC implementations, due to an anomaly in the NFKC specifications.

Return value: Returns the Pr29_rc value PR29_SUCCESS on success, and PR29_PROBLEM if the input sequence is a "problem sequence" (i.e., may be normalized into different strings by different implementations).

Definition at line 1237 of file pr29.c.

References PR29_PROBLEM, and PR29_SUCCESS.

Referenced by pr29_4z().

5.11.2.2 int pr29_4z (const uint32_t ∗ *in*)

pr29_4z - check if input trigger Unicode normalization bugs

Parameters:

    in zero terminated array of Unicode code points.

Check the input to see if it may be normalized into different strings by different NFKC implementations, due to an anomaly in the NFKC specifications.

Return value: Returns the Pr29_rc value PR29_SUCCESS on success, and PR29_PROBLEM if the input sequence is a "problem sequence" (i.e., may be normalized into different strings by different implementations).

Definition at line 1278 of file pr29.c.

References pr29_4().

Referenced by pr29_8z().

5.11.2.3 int pr29_8z (const char ∗ *in*)

pr29_8z - check if input trigger Unicode normalization bugs

Parameters:

    in zero terminated input UTF-8 string.

Check the input to see if it may be normalized into different strings by different NFKC implementations, due to an anomaly in the NFKC specifications.

Return value: Returns the Pr29_rc value PR29_SUCCESS on success, and PR29_PROBLEM if the input sequence is a "problem sequence" (i.e., may be normalized into different strings by different implementations), or PR29_STRINGPREP_ERROR if there was a problem converting the string from UTF-8 to UCS-4.

Definition at line 1303 of file pr29.c.

References pr29_4z(), PR29_STRINGPREP_ERROR, stringprep_utf8_to_ucs4(), and uint32_t.

5.11.2.4 const char∗ pr29_strerror (Pr29_rc *rc*)

pr29_strerror - return string describing pr29 error code

Parameters:

    rc an Pr29_rc return code.

Convert a return code integer to a text string. This string can be used to output a diagnostic message to the user.

PR29_SUCCESS: Successful operation. This value is guaranteed to always be zero, the remaining ones are only guaranteed to hold non-zero values, for logical comparison purposes. PR29_PROBLEM: A problem sequence was encountered. PR29_STRINGPREP_ERROR: The character set conversion failed (only for pr29_8() and pr29_8z()).

Return value: Returns a pointer to a statically allocated string containing a description of the error with the return code .

Definition at line 49 of file strerror-pr29.c.

References _, PR29_PROBLEM, PR29_STRINGPREP_ERROR, and PR29_SUCCESS.

5.13.3 Function Documentation

5.13.3.1 int punycode_decode (size_t *input_length*, const char *input*[ ], size_t ∗ *output_length*, punycode_uint *output*[ ], unsigned char *case_flags*[ ])

punycode_decode - decode Punycode to Unicode

Parameters:

> *input_length* The number of ASCII code points in the array.
>
> *input* An array of ASCII code points (0..7F).
>
> *output_length* The caller passes in the maximum number of code points that it can receive into the array (which is also the maximum number of flags that it can receive into the array, if is not a NULL pointer). On successful return it will contain the number of code points actually output (which is also the number of flags actually output, if case_flags is not a null pointer). The decoder will never need to output more code points than the number of ASCII code points in the input, because of the way the encoding is defined. The number of code points output cannot exceed the maximum possible value of a punycode_uint, even if the supplied is greater than that.
>
> *output* An array of code points like the input argument of punycode_encode() (see above).
>
> *case_flags* A NULL pointer (if the flags are not needed by the caller) or an array of boolean values parallel to the array. Nonzero (true, flagged) suggests that the corresponding Unicode character be forced to uppercase by the caller (if possible), and zero (false, unflagged) suggests that it be forced to lowercase (if possible). ASCII code points (0..7F) are output already in the proper case, but their flags will be set appropriately so that applying the flags would be harmless.

Converts Punycode to a sequence of code points (presumed to be Unicode code points).

Return value: The return value can be any of the Punycode_status values defined above. If not PUNYCODE_SUCCESS, then , , and might contain garbage.

Definition at line 337 of file punycode.c.

References base, basic, delim, flagged, initial_bias, initial_n, punycode_bad_input, punycode_big_output, punycode_overflow, punycode_success, tmax, and tmin.

5.13.3.2   int punycode_encode (size_t *input_length*, const punycode_uint *input*[ ], const unsigned char *case_flags*[ ], size_t ∗ *output_length*, char *output*[ ])

punycode_encode - encode Unicode to Punycode

Parameters:

>   *input_length* The number of code points in the array and the number of flags in the array.

>   *input* An array of code points. They are presumed to be Unicode code points, but that is not strictly REQUIRED. The array contains code points, not code units. UTF-16 uses code units D800 through DFFF to refer to code points 10000..10FFFF. The code points D800..DFFF do not occur in any valid Unicode string. The code points that can occur in Unicode strings (0..D7FF and E000..10FFFF) are also called Unicode scalar values.

>   *case_flags* A NULL pointer or an array of boolean values parallel to the array. Nonzero (true, flagged) suggests that the corresponding Unicode character be forced to uppercase after being decoded (if possible), and zero (false, unflagged) suggests that it be forced to lowercase (if possible). ASCII code points (0..7F) are encoded literally, except that ASCII letters are forced to uppercase or lowercase according to the corresponding case flags. If is a NULL pointer then ASCII letters are left as they are, and other code points are treated as unflagged.

>   *output_length* The caller passes in the maximum number of ASCII code points that it can receive. On successful return it will contain the number of ASCII code points actually output.

>   *output* An array of ASCII code points. It is ∗not∗ null-terminated; it will contain zeros if and only if the contains zeros. (Of course the caller can leave room for a terminator and add one if needed.)

Converts a sequence of code points (presumed to be Unicode code points) to Punycode.

Return value: The return value can be any of the Punycode_status values defined above except PUNYCODE_BAD_INPUT. If not PUNYCODE_SUCCESS, then and might contain garbage.

Definition at line 188 of file punycode.c.

References base, basic, delimiter, initial_bias, initial_n, punycode_big_output, punycode_overflow, punycode_success, tmax, and tmin.

5.14.3 Function Documentation

5.14.3.1 int punycode_decode (size_t *input_length*, const char *input*[ ], size_t ∗ *output_length*, punycode_uint *output*[ ], unsigned char *case_flags*[ ])

punycode_decode - decode Punycode to Unicode

Parameters:

> *input_length* The number of ASCII code points in the array.
>
> *input* An array of ASCII code points (0..7F).
>
> *output_length* The caller passes in the maximum number of code points that it can receive into the array (which is also the maximum number of flags that it can receive into the array, if is not a NULL pointer). On successful return it will contain the number of code points actually output (which is also the number of flags actually output, if case_flags is not a null pointer). The decoder will never need to output more code points than the number of ASCII code points in the input, because of the way the encoding is defined. The number of code points output cannot exceed the maximum possible value of a punycode_uint, even if the supplied is greater than that.
>
> *output* An array of code points like the input argument of punycode_encode() (see above).
>
> *case_flags* A NULL pointer (if the flags are not needed by the caller) or an array of boolean values parallel to the array. Nonzero (true, flagged) suggests that the corresponding Unicode character be forced to uppercase by the caller (if possible), and zero (false, unflagged) suggests that it be forced to lowercase (if possible). ASCII code points (0..7F) are output already in the proper case, but their flags will be set appropriately so that applying the flags would be harmless.

Converts Punycode to a sequence of code points (presumed to be Unicode code points).

Return value: The return value can be any of the Punycode_status values defined above. If not PUNYCODE_SUCCESS, then , , and might contain garbage.

Definition at line 337 of file punycode.c.

References base, basic, delim, flagged, initial_bias, initial_n, punycode_bad_input, punycode_big_output, punycode_overflow, punycode_success, tmax, and tmin.

5.14.3.2 int punycode_encode (size_t *input_length*, const punycode_uint *input*[ ], const unsigned char *case_flags*[ ], size_t ∗ *output_length*, char *output*[ ])

punycode_encode - encode Unicode to Punycode

Parameters:

> *input_length* The number of code points in the array and the number of flags in the array.

input An array of code points. They are presumed to be Unicode code points, but that is not strictly REQUIRED. The array contains code points, not code units. UTF-16 uses code units D800 through DFFF to refer to code points 10000..10FFFF. The code points D800..DFFF do not occur in any valid Unicode string. The code points that can occur in Unicode strings (0..D7FF and E000..10FFFF) are also called Unicode scalar values.

case_flags A NULL pointer or an array of boolean values parallel to the array. Nonzero (true, flagged) suggests that the corresponding Unicode character be forced to uppercase after being decoded (if possible), and zero (false, unflagged) suggests that it be forced to lowercase (if possible). ASCII code points (0..7F) are encoded literally, except that ASCII letters are forced to uppercase or lowercase according to the corresponding case flags. If is a NULL pointer then ASCII letters are left as they are, and other code points are treated as unflagged.

output_length The caller passes in the maximum number of ASCII code points that it can receive. On successful return it will contain the number of ASCII code points actually output.

output An array of ASCII code points. It is ∗not∗ null-terminated; it will contain zeros if and only if the contains zeros. (Of course the caller can leave room for a terminator and add one if needed.)

Converts a sequence of code points (presumed to be Unicode code points) to Punycode.

Return value: The return value can be any of the Punycode_status values defined above except PUNYCODE_BAD_INPUT. If not PUNYCODE_SUCCESS, then and might contain garbage.

Definition at line 188 of file punycode.c.

References base, basic, delimiter, initial_bias, initial_n, punycode_big_output, punycode_overflow, punycode_success, tmax, and tmin.

Referenced by idna_to_ascii_4i().

5.14.3.3   const char∗ punycode_strerror (Punycode_status *rc*)

punycode_strerror - return string describing punycode error code

Parameters:

   rc an Punycode_status return code.

Convert a return code integer to a text string. This string can be used to output a diagnostic message to the user.

PUNYCODE_SUCCESS: Successful operation. This value is guaranteed to always be zero, the remaining ones are only guaranteed to hold non-zero values, for logical comparison purposes. PUNYCODE_-BAD_INPUT: Input is invalid. PUNYCODE_BIG_OUTPUT: Output would exceed the space provided. PUNYCODE_OVERFLOW: Input needs wider integers to process.

Return value: Returns a pointer to a statically allocated string containing a description of the error with the return code .

Definition at line 49 of file strerror-punycode.c.

References _, PUNYCODE_BAD_INPUT, PUNYCODE_BIG_OUTPUT, PUNYCODE_OVERFLOW, and PUNYCODE_SUCCESS.

5.16.1.1 #define _(String) dgettext (PACKAGE, String)

Definition at line 29 of file strerror-idna.c.

Referenced by idna_strerror(), pr29_strerror(), punycode_strerror(), stringprep_strerror(), and tld_-strerror().

5.16.2 Function Documentation

5.16.2.1 const char∗ idna_strerror (Idna_rc *rc*)

idna_strerror - return string describing idna error code

Parameters:

> *rc* an Idna_rc return code.

Convert a return code integer to a text string. This string can be used to output a diagnostic message to the user.

IDNA_SUCCESS: Successful operation. This value is guaranteed to always be zero, the remaining ones are only guaranteed to hold non-zero values, for logical comparison purposes. IDNA_STRINGPREP_-ERROR: Error during string preparation. IDNA_PUNYCODE_ERROR: Error during punycode operation. IDNA_CONTAINS_NON_LDH: For IDNA_USE_STD3_ASCII_RULES, indicate that the string contains non-LDH ASCII characters. IDNA_CONTAINS_MINUS: For IDNA_USE_STD3_ASCII_RULES, indi-cate that the string contains a leading or trailing hyphen-minus (U+002D). IDNA_INVALID_LENGTH: The final output string is not within the (inclusive) range 1 to 63 characters. IDNA_NO_ACE_PREFIX: The string does not contain the ACE prefix (for ToUnicode). IDNA_ROUNDTRIP_VERIFY_ERROR: The ToASCII operation on output string does not equal the input. IDNA_CONTAINS_ACE_PREFIX: The input contains the ACE prefix (for ToASCII). IDNA_ICONV_ERROR: Could not convert string in locale encoding. IDNA_MALLOC_ERROR: Could not allocate buffer (this is typically a fatal error). IDNA_DLOPEN_ERROR: Could not dlopen the libcidn DSO (only used internally in libc).

Return value: Returns a pointer to a statically allocated string containing a description of the error with the return code .

Definition at line 65 of file strerror-idna.c.

5.17.2 Function Documentation

5.17.2.1 const char∗ pr29_strerror (Pr29_rc *rc*)

pr29_strerror - return string describing pr29 error code

Parameters:

   rc an Pr29_rc return code.

Convert a return code integer to a text string. This string can be used to output a diagnostic message to the user.

PR29_SUCCESS: Successful operation. This value is guaranteed to always be zero, the remaining ones are only guaranteed to hold non-zero values, for logical comparison purposes. PR29_PROBLEM: A problem sequence was encountered. PR29_STRINGPREP_ERROR: The character set conversion failed (only for pr29_8() and pr29_8z()).

Return value: Returns a pointer to a statically allocated string containing a description of the error with the return code .

Definition at line 49 of file strerror-pr29.c.

References _, PR29_PROBLEM, PR29_STRINGPREP_ERROR, and PR29_SUCCESS.

5.18.2   Function Documentation

5.18.2.1   const char∗ punycode_strerror (Punycode_status *rc*)

punycode_strerror - return string describing punycode error code

Parameters:

> *rc* an Punycode_status return code.

Convert a return code integer to a text string. This string can be used to output a diagnostic message to the user.

PUNYCODE_SUCCESS: Successful operation. This value is guaranteed to always be zero, the remaining ones are only guaranteed to hold non-zero values, for logical comparison purposes. PUNYCODE_-BAD_INPUT: Input is invalid. PUNYCODE_BIG_OUTPUT: Output would exceed the space provided. PUNYCODE_OVERFLOW: Input needs wider integers to process.

Return value: Returns a pointer to a statically allocated string containing a description of the error with the return code .

Definition at line 49 of file strerror-punycode.c.

References _, PUNYCODE_BAD_INPUT, PUNYCODE_BIG_OUTPUT, PUNYCODE_OVERFLOW, and PUNYCODE_SUCCESS.

5.19.2   Function Documentation

5.19.2.1   const char∗ stringprep_strerror (Stringprep_rc rc)

stringprep_strerror - return string describing stringprep error code

Parameters:

   rc   a Stringprep_rc return code.

Convert a return code integer to a text string. This string can be used to output a diagnostic message to the user.

STRINGPREP_OK: Successful operation. This value is guaranteed to always be zero, the remaining ones are only guaranteed to hold non-zero values, for logical comparison purposes. STRINGPREP_-CONTAINS_UNASSIGNED: String contain unassigned Unicode code points, which is forbidden by the profile. STRINGPREP_CONTAINS_PROHIBITED: String contain code points prohibited by the profile. STRINGPREP_BIDI_BOTH_L_AND_RAL: String contain code points with conflicting bidirection category. STRINGPREP_BIDI_LEADTRAIL_NOT_RAL: Leading and trailing character in string not of proper bidirectional category. STRINGPREP_BIDI_CONTAINS_PROHIBITED: Contains prohibited code points detected by bidirectional code. STRINGPREP_TOO_SMALL_BUFFER: Buffer handed to function was too small. This usually indicate a problem in the calling application. STRINGPREP_-PROFILE_ERROR: The stringprep profile was inconsistent. This usually indicate an internal error in the library. STRINGPREP_FLAG_ERROR: The supplied flag conflicted with profile. This usually indicate a problem in the calling application. STRINGPREP_UNKNOWN_PROFILE: The supplied profile name was not known to the library. STRINGPREP_NFKC_FAILED: The Unicode NFKC operation failed. This usually indicate an internal error in the library. STRINGPREP_MALLOC_ERROR: The malloc() was out of memory. This is usually a fatal error.

Return value: Returns a pointer to a statically allocated string containing a description of the error with the return code .

5.21.2 Function Documentation

5.21.2.1 int stringprep (char * *in*, size_t *maxlen*, Stringprep_profile_flags *flags*, const Stringprep_profile * *profile*)

stringprep - prepare internationalized string

Parameters:

   in input/ouput array with string to prepare.

   maxlen maximum length of input/output array.

flags a Stringprep_profile_flags value, or 0.

profile pointer to Stringprep_profile to use.

Prepare the input zero terminated UTF-8 string according to the stringprep profile, and write back the result to the input string.

Note that you must convert strings entered in the systems locale into UTF-8 before using this function, see stringprep_locale_to_utf8().

Since the stringprep operation can expand the string, indicate how large the buffer holding the string is. This function will not read or write to characters outside that size.

The are one of Stringprep_profile_flags values, or 0.

The contain the Stringprep_profile instructions to perform. Your application can define new profiles, possibly re-using the generic stringprep tables that always will be part of the library, or use one of the currently supported profiles.

Return value: Returns STRINGPREP_OK iff successful, or an error code.

Definition at line 359 of file stringprep.c.

References stringprep_4i(), STRINGPREP_MALLOC_ERROR, STRINGPREP_OK, STRINGPREP_-TOO_SMALL_BUFFER, stringprep_ucs4_to_utf8(), stringprep_utf8_to_ucs4(), and uint32_t.

Referenced by stringprep_profile().

5.21.2.2 int stringprep_4i (uint32_t ∗ *ucs4*, size_t ∗ *len*, size_t *maxucs4len*, Stringprep_profile_flags *flags*, const Stringprep_profile ∗ *profile*)

stringprep_4i - prepare internationalized string

Parameters:

ucs4 input/output array with string to prepare.

len on input, length of input array with Unicode code points, on exit, length of output array with Unicode code points.

maxucs4len maximum length of input/output array.

flags a Stringprep_profile_flags value, or 0.

profile pointer to Stringprep_profile to use.

Prepare the input UCS-4 string according to the stringprep profile, and write back the result to the input string.

The input is not required to be zero terminated ([] = 0). The output will not be zero terminated unless [] = 0. Instead, see stringprep_4zi() if your input is zero terminated or if you want the output to be.

Since the stringprep operation can expand the string, indicate how large the buffer holding the string is. This function will not read or write to code points outside that size.

The are one of Stringprep_profile_flags values, or 0.

The contain the Stringprep_profile instructions to perform. Your application can define new profiles, possibly re-using the generic stringprep tables that always will be part of the library, or use one of the currently supported profiles.

Return value: Returns STRINGPREP_OK iff successful, or an Stringprep_rc error code.

Definition at line 138 of file stringprep.c.

Referenced by stringprep().

5.21.2.3 int stringprep_4zi (uint32_t ∗ *ucs4*, size_t *maxucs4len*, Stringprep_profile_flags *flags*, const Stringprep_profile ∗ *profile*)

stringprep_4zi - prepare internationalized string

Parameters:

> *ucs4* input/output array with zero terminated string to prepare.
>
> *maxucs4len* maximum length of input/output array.
>
> *flags* a Stringprep_profile_flags value, or 0.
>
> *profile* pointer to Stringprep_profile to use.

Prepare the input zero terminated UCS-4 string according to the stringprep profile, and write back the result to the input string.

Since the stringprep operation can expand the string, indicate how large the buffer holding the string is. This function will not read or write to code points outside that size.

The are one of Stringprep_profile_flags values, or 0.

The contain the Stringprep_profile instructions to perform. Your application can define new profiles, possibly re-using the generic stringprep tables that always will be part of the library, or use one of the currently supported profiles.

Return value: Returns STRINGPREP_OK iff successful, or an Stringprep_rc error code.

Definition at line 319 of file stringprep.c.

5.21.2.4 int stringprep_profile (const char ∗ *in*, char ∗∗ *out*, const char ∗ *profile*, Stringprep_profile_flags *flags*)

stringprep_profile - prepare internationalized string

Parameters:

> *in* input array with UTF-8 string to prepare.
>
> *out* output variable with pointer to newly allocate string.
>
> *profile* name of stringprep profile to use.
>
> *flags* a Stringprep_profile_flags value, or 0.

Prepare the input zero terminated UTF-8 string according to the stringprep profile, and return the result in a newly allocated variable.

Note that you must convert strings entered in the systems locale into UTF-8 before using this function, see stringprep_locale_to_utf8().

The output variable must be deallocated by the caller.

The are one of Stringprep_profile_flags values, or 0.

The specifies the name of the stringprep profile to use. It must be one of the internally supported stringprep profiles.

Return value: Returns STRINGPREP_OK iff successful, or an error code.

Definition at line 438 of file stringprep.c.

References Stringprep_profiles::name, stringprep(), STRINGPREP_MALLOC_ERROR, stringprep_-profiles, STRINGPREP_UNKNOWN_PROFILE, and Stringprep_profiles::tables.

Definition at line 37 of file stringprep.h.

5.22.4 Function Documentation

5.22.4.1 int stringprep (char ∗ *in*, size_t *maxlen*, Stringprep_profile_flags *flags*, const Stringprep_profile ∗ *profile*)

stringprep - prepare internationalized string

Parameters:

>*in* input/ouput array with string to prepare.
>*maxlen* maximum length of input/output array.
>*flags* a Stringprep_profile_flags value, or 0.
>*profile* pointer to Stringprep_profile to use.

Prepare the input zero terminated UTF-8 string according to the stringprep profile, and write back the result to the input string.

Note that you must convert strings entered in the systems locale into UTF-8 before using this function, see stringprep_locale_to_utf8().

Since the stringprep operation can expand the string, indicate how large the buffer holding the string is. This function will not read or write to characters outside that size.

The are one of Stringprep_profile_flags values, or 0.

The contain the Stringprep_profile instructions to perform. Your application can define new profiles, possibly re-using the generic stringprep tables that always will be part of the library, or use one of the currently supported profiles.

Return value: Returns STRINGPREP_OK iff successful, or an error code.

Definition at line 359 of file stringprep.c.

References stringprep_4i(), STRINGPREP_MALLOC_ERROR, STRINGPREP_OK, STRINGPREP_-TOO_SMALL_BUFFER, stringprep_ucs4_to_utf8(), stringprep_utf8_to_ucs4(), and uint32_t.

Referenced by stringprep_profile().

5.22.4.2 int stringprep_4i (uint32_t ∗ *ucs4*, size_t ∗ *len*, size_t *maxucs4len*, Stringprep_profile_flags *flags*, const Stringprep_profile ∗ *profile*)

stringprep_4i - prepare internationalized string

Parameters:

ucs4 input/output array with string to prepare.

len on input, length of input array with Unicode code points, on exit, length of output array with Unicode code points.

maxucs4len maximum length of input/output array.

flags a Stringprep_profile_flags value, or 0.

profile pointer to Stringprep_profile to use.

Prepare the input UCS-4 string according to the stringprep profile, and write back the result to the input string.

The input is not required to be zero terminated ([] = 0). The output will not be zero terminated unless [] = 0. Instead, see stringprep_4zi() if your input is zero terminated or if you want the output to be.

Since the stringprep operation can expand the string, indicate how large the buffer holding the string is. This function will not read or write to code points outside that size.

The are one of Stringprep_profile_flags values, or 0.

The contain the Stringprep_profile instructions to perform. Your application can define new profiles, possibly re-using the generic stringprep tables that always will be part of the library, or use one of the currently supported profiles.

Return value: Returns STRINGPREP_OK iff successful, or an Stringprep_rc error code.

Definition at line 138 of file stringprep.c.

References Stringprep_table::operation, STRINGPREP_BIDI, STRINGPREP_BIDI_BOTH_L_-AND_RAL, STRINGPREP_BIDI_CONTAINS_PROHIBITED, STRINGPREP_BIDI_L_TABLE, STRINGPREP_BIDI_LEADTRAIL_NOT_RAL, STRINGPREP_BIDI_PROHIBIT_TABLE, STRINGPREP_BIDI_RAL_TABLE, STRINGPREP_CONTAINS_PROHIBITED, STRINGPREP_-CONTAINS_UNASSIGNED, STRINGPREP_FLAG_ERROR, STRINGPREP_MAP_TABLE, STRINGPREP_NFKC, STRINGPREP_NFKC_FAILED, STRINGPREP_NO_NFKC, STRINGPREP_-NO_UNASSIGNED, STRINGPREP_OK, STRINGPREP_PROFILE_ERROR, STRINGPREP_-PROHIBIT_TABLE, STRINGPREP_TOO_SMALL_BUFFER, stringprep_ucs4_nfkc_normalize(), STRINGPREP_UNASSIGNED_TABLE, uint32_t, and UNAPPLICAPLEFLAGS.

Referenced by stringprep().

5.22.4.3 int stringprep_4zi (uint32_t ∗ *ucs4*, size_t *maxucs4len*, Stringprep_profile_flags *flags*, const Stringprep_profile ∗ *profile*)

stringprep_4zi - prepare internationalized string

Parameters:

ucs4 input/output array with zero terminated string to prepare.

maxucs4len maximum length of input/output array.

flags a Stringprep_profile_flags value, or 0.

profile pointer to Stringprep_profile to use.

Prepare the input zero terminated UCS-4 string according to the stringprep profile, and write back the result to the input string.

Since the stringprep operation can expand the string, indicate how large the buffer holding the string is. This function will not read or write to code points outside that size.

The are one of Stringprep_profile_flags values, or 0.

The contain the Stringprep_profile instructions to perform. Your application can define new profiles, possibly re-using the generic stringprep tables that always will be part of the library, or use one of the currently supported profiles.

Return value: Returns STRINGPREP_OK iff successful, or an Stringprep_rc error code.

Definition at line 319 of file stringprep.c.

5.22.4.4 const char∗ stringprep_check_version (const char ∗ *req_version*)

stringprep_check_version - check for library version

Parameters:

    req_version Required version number, or NULL.

Check that the the version of the library is at minimum the requested one and return the version string; return NULL if the condition is not satisfied. If a NULL is passed to this function, no check is done, but the version string is simply returned.

See STRINGPREP_VERSION for a suitable string.

Return value: Version string of run-time library, or NULL if the run-time library does not meet the required version number.

Definition at line 43 of file version.c.

5.22.4.5 char∗ stringprep_convert (const char ∗ *str*, const char ∗ *to_codeset*, const char ∗ *from_codeset*)

stringprep_convert - encode string using new character set

Parameters:

    str input zero-terminated string.

    to_codeset name of destination character set.

    from_codeset name of origin character set, as used by .

Convert the string from one character set to another using the system's iconv() function.

Return value: Returns newly allocated zero-terminated string which is transcoded into to_codeset.

Definition at line 110 of file toutf8.c.

Referenced by stringprep_locale_to_utf8(), and stringprep_utf8_to_locale().

5.22.4.6 const char∗ stringprep_locale_charset (void)

stringprep_locale_charset - return charset used in current locale

Find out current locale charset. The function respect the CHARSET environment variable, but typically uses nl_langinfo(CODESET) when it is supported. It fall back on "ASCII" if CHARSET isn't set and nl_langinfo isn't supported or return anything.

Note that this function return the application's locale's preferred charset (or thread's locale's preffered charset, if your system support thread-specific locales). It does not return what the system may be using. Thus, if you receive data from external sources you cannot in general use this function to guess what charset it is encoded in. Use stringprep_convert from the external representation into the charset returned by this function, to have data in the locale encoding.

Return value: Return the character set used by the current locale. It will never return NULL, but use "ASCII" as a fallback.

Definition at line 79 of file toutf8.c.

Referenced by stringprep_locale_to_utf8(), and stringprep_utf8_to_locale().

5.22.4.7 char∗ stringprep_locale_to_utf8 (const char ∗ *str*)

stringprep_locale_to_utf8 - convert locale encoded string to UTF-8

Parameters:

> *str* input zero terminated string.

Convert string encoded in the locale's character set into UTF-8 by using stringprep_convert().

Return value: Returns newly allocated zero-terminated string which is transcoded into UTF-8.

Definition at line 137 of file toutf8.c.

References stringprep_convert(), and stringprep_locale_charset().

Referenced by idna_to_ascii_lz(), idna_to_unicode_lzlz(), and tld_check_lz().

5.22.4.8 int stringprep_profile (const char ∗ *in*, char ∗∗ *out*, const char ∗ *profile*, Stringprep_profile_flags *flags*)

stringprep_profile - prepare internationalized string

Parameters:

> *in* input array with UTF-8 string to prepare.
>
> *out* output variable with pointer to newly allocate string.
>
> *profile* name of stringprep profile to use.
>
> *flags* a Stringprep_profile_flags value, or 0.

Prepare the input zero terminated UTF-8 string according to the stringprep profile, and return the result in a newly allocated variable.

Note that you must convert strings entered in the systems locale into UTF-8 before using this function, see stringprep_locale_to_utf8().

The output variable must be deallocated by the caller.

The are one of Stringprep_profile_flags values, or 0.

The specifies the name of the stringprep profile to use. It must be one of the internally supported stringprep profiles.

Return value: Returns STRINGPREP_OK iff successful, or an error code.

Definition at line 438 of file stringprep.c.

References Stringprep_profiles::name, stringprep(), STRINGPREP_MALLOC_ERROR, stringprep_-profiles, STRINGPREP_UNKNOWN_PROFILE, and Stringprep_profiles::tables.

5.22.4.9 const char∗ stringprep_strerror (Stringprep_rc *rc*)

stringprep_strerror - return string describing stringprep error code

Parameters:

> *rc* a Stringprep_rc return code.

Convert a return code integer to a text string. This string can be used to output a diagnostic message to the user.

STRINGPREP_OK: Successful operation. This value is guaranteed to always be zero, the remaining ones are only guaranteed to hold non-zero values, for logical comparison purposes. STRINGPREP_-CONTAINS_UNASSIGNED: String contain unassigned Unicode code points, which is forbidden by the profile. STRINGPREP_CONTAINS_PROHIBITED: String contain code points prohibited by the profile. STRINGPREP_BIDI_BOTH_L_AND_RAL: String contain code points with conflicting bidirection category. STRINGPREP_BIDI_LEADTRAIL_NOT_RAL: Leading and trailing character in string not of proper bidirectional category. STRINGPREP_BIDI_CONTAINS_PROHIBITED: Contains prohibited code points detected by bidirectional code. STRINGPREP_TOO_SMALL_BUFFER: Buffer handed to function was too small. This usually indicate a problem in the calling application. STRINGPREP_-PROFILE_ERROR: The stringprep profile was inconsistent. This usually indicate an internal error in the library. STRINGPREP_FLAG_ERROR: The supplied flag conflicted with profile. This usually indicate a problem in the calling application. STRINGPREP_UNKNOWN_PROFILE: The supplied profile name was not known to the library. STRINGPREP_NFKC_FAILED: The Unicode NFKC operation failed. This usually indicate an internal error in the library. STRINGPREP_MALLOC_ERROR: The malloc() was out of memory. This is usually a fatal error.

Return value: Returns a pointer to a statically allocated string containing a description of the error with the return code .

Definition at line 69 of file strerror-stringprep.c.

References _, STRINGPREP_BIDI_BOTH_L_AND_RAL, STRINGPREP_BIDI_CONTAINS_-PROHIBITED, STRINGPREP_BIDI_LEADTRAIL_NOT_RAL, STRINGPREP_CONTAINS_-PROHIBITED, STRINGPREP_CONTAINS_UNASSIGNED, STRINGPREP_FLAG_ERROR, STRINGPREP_MALLOC_ERROR, STRINGPREP_NFKC_FAILED, STRINGPREP_OK, STRINGPREP_PROFILE_ERROR, STRINGPREP_TOO_SMALL_BUFFER, and STRINGPREP_-UNKNOWN_PROFILE.

5.22.4.10 uint32_t∗ stringprep_ucs4_nfkc_normalize (uint32_t ∗ *str*, ssize_t *len*)

stringprep_ucs4_nfkc_normalize - normalize Unicode string

Parameters:

> *str* a Unicode string.
>
> *len* length of array, or -1 if is nul-terminated.

Converts UCS4 string into UTF-8 and runs stringprep_utf8_nfkc_normalize().

Return value: a newly allocated Unicode string, that is the NFKC normalized form of .

Definition at line 1048 of file nfkc.c.

References G_NORMALIZE_NFKC, stringprep_ucs4_to_utf8(), and uint32_t.

Referenced by stringprep_4i().

5.22.4.11 char∗ stringprep_ucs4_to_utf8 (const uint32_t ∗ *str*, ssize_t *len*, size_t ∗ *items_read*, size_t ∗ *items_written*)

stringprep_ucs4_to_utf8 - convert UCS-4 string to UTF-8

Parameters:

> *str* a UCS-4 encoded string
>
> *len* the maximum length of to use. If < 0, then the string is terminated with a 0 character.
>
> *items_read* location to store number of characters read read, or NULL.
>
> *items_written* location to store number of bytes written or NULL. The value here stored does not include the trailing 0 byte.

Convert a string from a 32-bit fixed width representation as UCS-4. to UTF-8. The result will be terminated with a 0 byte.

Return value: a pointer to a newly allocated UTF-8 string. This value must be freed with free(). If an error occurs, NULL will be returned and set.

Definition at line 1001 of file nfkc.c.

References glong.

Referenced by idna_to_ascii_4i(), idna_to_unicode_44i(), idna_to_unicode_8z8z(), stringprep(), and stringprep_ucs4_nfkc_normalize().

5.22.4.12 int stringprep_unichar_to_utf8 (uint32_t *c*, char ∗ *outbuf*)

stringprep_unichar_to_utf8 - convert Unicode code point to UTF-8

Parameters:

> *c* a ISO10646 character code
>
> *outbuf* output buffer, must have at least 6 bytes of space. If NULL, the length will be computed and returned and nothing will be written to .

Converts a single character to UTF-8.

Return value: number of bytes written.

Definition at line 956 of file nfkc.c.

5.22.4.13 char∗ stringprep_utf8_nfkc_normalize (const char ∗ *str*, ssize_t *len*)

stringprep_utf8_nfkc_normalize - normalize Unicode string

Parameters:

> *str* a UTF-8 encoded string.

len length of , in bytes, or -1 if is nul-terminated.

Converts a string into canonical form, standardizing such issues as whether a character with an accent is represented as a base character and combining accent or as a single precomposed character.

The normalization mode is NFKC (ALL COMPOSE). It standardizes differences that do not affect the text content, such as the above-mentioned accent representation. It standardizes the "compatibility" characters in Unicode, such as SUPERSCRIPT THREE to the standard forms (in this case DIGIT THREE). Formatting information may be lost but for most text operations such characters should be considered the same. It returns a result with composed forms rather than a maximally decomposed form.

Return value: a newly allocated string, that is the NFKC normalized form of .

Definition at line 1031 of file nfkc.c.

References G_NORMALIZE_NFKC.

5.22.4.14 char∗ stringprep_utf8_to_locale (const char ∗ *str*)

stringprep_utf8_to_locale - encode UTF-8 string to locale encoding

Parameters:

str input zero terminated string.

Convert string encoded in UTF-8 into the locale's character set by using stringprep_convert().

Return value: Returns newly allocated zero-terminated string which is transcoded into the locale's character set.

Definition at line 153 of file toutf8.c.

References stringprep_convert(), and stringprep_locale_charset().

Referenced by idna_to_unicode_8zlz().

5.22.4.15 uint32_t∗ stringprep_utf8_to_ucs4 (const char ∗ *str*, ssize_t *len*, size_t ∗ *items_written*)

stringprep_utf8_to_ucs4 - convert UTF-8 string to UCS-4

Parameters:

str a UTF-8 encoded string

len the maximum length of to use. If < 0, then the string is nul-terminated.

items_written location to store the number of characters in the result, or NULL.

Convert a string from UTF-8 to a 32-bit fixed width representation as UCS-4, assuming valid UTF-8 input. This function does no error checking on the input.

Return value: a pointer to a newly allocated UCS-4 string. This value must be freed with free().

Definition at line 977 of file nfkc.c.

References glong.

Referenced by idna_to_ascii_4i(), idna_to_ascii_8z(), idna_to_unicode_8z4z(), pr29_8z(), stringprep(), and tld_check_8z().

5.22.4.16 uint32_t stringprep_utf8_to_unichar (const char ∗ *p*)

stringprep_utf8_to_unichar - convert UTF-8 to Unicode code point

Parameters:

    p a pointer to Unicode character encoded as UTF-8

Converts a sequence of bytes encoded as UTF-8 to a Unicode character. If `does` not point to a valid UTF-8 encoded character, results are undefined.

Return value: the resulting character.

Definition at line 939 of file nfkc.c.

5.23.1 Define Documentation

5.23.1.1 #define DOTP(c)

Value:

```
((c) == 0x002E || (c) == 0x3002 ||        \
                (c) == 0xFF0E || (c) == 0xFF61)
```

Definition at line 95 of file tld.c.

5.23.2 Function Documentation

5.23.2.1 int tld_check_4 (const uint32_t ∗ *in*, size_t *inlen*, size_t ∗ *errpos*, const Tld_table ∗∗ *overrides*)

tld_check_4 - verify that characters are permitted

Parameters:

   in Array of unicode code points to process. Does not need to be zero terminated.

inlen Number of unicode code points.

errpos Position of offending character is returned here.

overrides A Tld_table array of additional domain restriction structures that complement and supersede the built-in information.

Test each of the code points in for whether or not they are allowed by the information in or by the built-in TLD restriction data. When data for the same TLD is available both internally and in , the information in takes precedence. If several entries for a specific TLD are found, the first one is used. If is NULL, only the built-in information is used. The position of the first offending character is returned in .

Return value: Returns the Tld_rc value TLD_SUCCESS if all code points are valid or when is null, TLD_- INVALID if a character is not allowed, or additional error codes on general failure conditions.

Definition at line 348 of file tld.c.

References tld_check_4t(), tld_default_table(), tld_get_4(), TLD_NO_TLD, and TLD_SUCCESS.

Referenced by tld_check_4z(), and tld_check_8z().

5.23.2.2 int tld_check_4t (const uint32_t ∗ *in*, size_t *inlen*, size_t ∗ *errpos*, const Tld_table ∗ *tld*)

tld_check_4t - verify that characters are permitted

Parameters:

in Array of unicode code points to process. Does not need to be zero terminated.

inlen Number of unicode code points.

errpos Position of offending character is returned here.

tld A Tld_table data structure representing the restrictions for which the input should be tested.

Test each of the code points in for whether or not they are allowed by the data structure in , return the position of the first character for which this is not the case in .

Return value: Returns the Tld_rc value TLD_SUCCESS if all code points are valid or when is null, TLD_- INVALID if a character is not allowed, or additional error codes on general failure conditions.

Definition at line 269 of file tld.c.

References TLD_SUCCESS, and uint32_t.

Referenced by tld_check_4(), and tld_check_4tz().

5.23.2.3 int tld_check_4tz (const uint32_t ∗ *in*, size_t ∗ *errpos*, const Tld_table ∗ *tld*)

tld_check_4tz - verify that characters are permitted

Parameters:

in Zero terminated array of unicode code points to process.

errpos Position of offending character is returned here.

tld A Tld_table data structure representing the restrictions for which the input should be tested.

Test each of the code points in for whether or not they are allowed by the data structure in , return the position of the first character for which this is not the case in .

Return value: Returns the [Tld_rc] value TLD_SUCCESS if all code points are valid or when is null, TLD_-INVALID if a character is not allowed, or additional error codes on general failure conditions.

Definition at line 311 of file tld.c.

References tld_check_4t(), TLD_NODATA, and uint32_t.

5.23.2.4 int tld_check_4z (const uint32_t ∗ *in*, size_t ∗ *errpos*, const [Tld_table] ∗∗ *overrides*)

tld_check_4z - verify that characters are permitted

Parameters:

> *in* Zero-terminated array of unicode code points to process.
>
> *errpos* Position of offending character is returned here.
>
> *overrides* A [Tld_table] array of additional domain restriction structures that complement and supersede the built-in information.

Test each of the code points in for whether or not they are allowed by the information in or by the built-in TLD restriction data. When data for the same TLD is available both internally and in , the information in takes precedence. If several entries for a specific TLD are found, the first one is used. If is NULL, only the built-in information is used. The position of the first offending character is returned in .

Return value: Returns the [Tld_rc] value TLD_SUCCESS if all code points are valid or when is null, TLD_-INVALID if a character is not allowed, or additional error codes on general failure conditions.

Definition at line 398 of file tld.c.

References tld_check_4(), TLD_NODATA, and uint32_t.

5.23.2.5 int tld_check_8z (const char ∗ *in*, size_t ∗ *errpos*, const [Tld_table] ∗∗ *overrides*)

tld_check_8z - verify that characters are permitted

Parameters:

> *in* Zero-terminated UTF8 string to process.
>
> *errpos* Position of offending character is returned here.
>
> *overrides* A [Tld_table] array of additional domain restriction structures that complement and supersede the built-in information.

Test each of the characters in for whether or not they are allowed by the information in or by the built-in TLD restriction data. When data for the same TLD is available both internally and in , the information in takes precedence. If several entries for a specific TLD are found, the first one is used. If is NULL, only the built-in information is used. The position of the first offending character is returned in . Note that the error position refers to the decoded character offset rather than the byte position in the string.

Return value: Returns the [Tld_rc] value TLD_SUCCESS if all characters are valid or when is null, TLD_-INVALID if a character is not allowed, or additional error codes on general failure conditions.

Definition at line 436 of file tld.c.

References stringprep_utf8_to_ucs4(), tld_check_4(), TLD_MALLOC_ERROR, TLD_NODATA, and uint32_t.

Referenced by tld_check_lz().

5.23.2.6   int tld_check_lz (const char ∗ *in*, size_t ∗ *errpos*, const Tld_table ∗∗ *overrides*)

tld_check_lz - verify that characters are permitted

Parameters:

> *in* Zero-terminated string in the current locales encoding to process.
>
> *errpos* Position of offending character is returned here.
>
> *overrides* A Tld_table array of additional domain restriction structures that complement and supersede the built-in information.

Test each of the characters in for whether or not they are allowed by the information in or by the built-in TLD restriction data. When data for the same TLD is available both internally and in , the information in takes precedence. If several entries for a specific TLD are found, the first one is used. If is NULL, only the built-in information is used. The position of the first offending character is returned in . Note that the error position refers to the decoded character offset rather than the byte position in the string.

Return value: Returns the Tld_rc value TLD_SUCCESS if all characters are valid or when is null, TLD_-INVALID if a character is not allowed, or additional error codes on general failure conditions.

Definition at line 481 of file tld.c.

References stringprep_locale_to_utf8(), tld_check_8z(), TLD_ICONV_ERROR, and TLD_NODATA.

5.23.2.7   const Tld_table∗ tld_default_table (const char ∗ *tld*, const Tld_table ∗∗ *overrides*)

tld_default_table - get table for a TLD name

Parameters:

> *tld* TLD name (e.g. "com") as zero terminated ASCII byte string.
>
> *overrides* Additional zero terminated array of Tld_table info-structures for TLDs, or NULL to only use library deault tables.

Get the TLD table for a named TLD, using the internal defaults, possibly overrided by the (optional) supplied tables.

Return value: Return structure corresponding to TLD , first looking through then thru built-in list, or NULL if no such structure found.

Definition at line 79 of file tld.c.

References _tld_tables, and tld_get_table().

Referenced by tld_check_4().

5.23.2.8   int tld_get_4 (const uint32_t ∗ *in*, size_t *inlen*, char ∗∗ *out*)

tld_get_4 - extract top level domain part in input Unicode string

Parameters:

> *in* Array of unicode code points to process. Does not need to be zero terminated.
>
> *inlen* Number of unicode code points.
>
> *out* Zero terminated ascii result string pointer.

Isolate the top-level domain of and return it as an ASCII string in .

Return value: Return TLD_SUCCESS on success, or the corresponding Tld_rc error code otherwise.

Definition at line 112 of file tld.c.

References DOTP, TLD_MALLOC_ERROR, TLD_NO_TLD, TLD_NODATA, TLD_SUCCESS, and uint32_t.

Referenced by tld_check_4(), tld_get_4z(), and tld_get_z().

5.23.2.9 int tld_get_4z (const uint32_t ∗ *in*, char ∗∗ *out*)

tld_get_4z - extract top level domain part in input Unicode string

Parameters:

    in Zero terminated array of unicode code points to process.

    out Zero terminated ascii result string pointer.

Isolate the top-level domain of and return it as an ASCII string in .

Return value: Return TLD_SUCCESS on success, or the corresponding Tld_rc error code otherwise.

Definition at line 160 of file tld.c.

References tld_get_4(), TLD_NODATA, and uint32_t.

5.23.2.10 const Tld_table∗ tld_get_table (const char ∗ *tld*, const Tld_table ∗∗ *tables*)

tld_get_table - get table for a TLD name in table

Parameters:

    tld TLD name (e.g. "com") as zero terminated ASCII byte string.

    tables Zero terminated array of Tld_table info-structures for TLDs.

Get the TLD table for a named TLD by searching through the given TLD table array.

Return value: Return structure corresponding to TLD by going thru , or return NULL if no such structure is found.

Definition at line 50 of file tld.c.

References Stringprep_profiles::tables.

Referenced by tld_default_table().

5.23.2.11 int tld_get_z (const char ∗ *in*, char ∗∗ *out*)

tld_get_z - extract top level domain part in input string

Parameters:

    in Zero terminated character array to process.

    out Zero terminated ascii result string pointer.

Isolate the top-level domain of and return it as an ASCII string in . The input string may be UTF-8, ISO-8859-1 or any ASCII compatible character encoding.

Return value: Return TLD_SUCCESS on success, or the corresponding Tld_rc error code otherwise.

Definition at line 186 of file tld.c.

References tld_get_4(), TLD_MALLOC_ERROR, and uint32_t.

5.24.3.5   int tld_check_8z (const char ∗ *in*, size_t ∗ *errpos*, const Tld_table ∗∗ *overrides*)

tld_check_8z - verify that characters are permitted

Parameters:

    in Zero-terminated UTF8 string to process.

    errpos Position of offending character is returned here.

    overrides A Tld_table array of additional domain restriction structures that complement and supersede the built-in information.

Test each of the characters in for whether or not they are allowed by the information in or by the built-in TLD restriction data. When data for the same TLD is available both internally and in , the information in takes precedence. If several entries for a specific TLD are found, the first one is used. If is NULL, only the built-in information is used. The position of the first offending character is returned in . Note that the error position refers to the decoded character offset rather than the byte position in the string.

Return value: Returns the Tld_rc value TLD_SUCCESS if all characters are valid or when is null, TLD_-INVALID if a character is not allowed, or additional error codes on general failure conditions.

Definition at line 436 of file tld.c.

References stringprep_utf8_to_ucs4(), tld_check_4(), TLD_MALLOC_ERROR, TLD_NODATA, and uint32_t.

Referenced by tld_check_lz().

5.24.3.6   int tld_check_lz (const char ∗ *in*, size_t ∗ *errpos*, const Tld_table ∗∗ *overrides*)

tld_check_lz - verify that characters are permitted

Parameters:

    in Zero-terminated string in the current locales encoding to process.

    errpos Position of offending character is returned here.

    overrides A Tld_table array of additional domain restriction structures that complement and supersede the built-in information.

Test each of the characters in for whether or not they are allowed by the information in or by the built-in TLD restriction data. When data for the same TLD is available both internally and in , the information in takes precedence. If several entries for a specific TLD are found, the first one is used. If is NULL, only the built-in information is used. The position of the first offending character is returned in . Note that the error position refers to the decoded character offset rather than the byte position in the string.

Return value: Returns the Tld_rc value TLD_SUCCESS if all characters are valid or when is null, TLD_-INVALID if a character is not allowed, or additional error codes on general failure conditions.

Definition at line 481 of file tld.c.

References stringprep_locale_to_utf8(), tld_check_8z(), TLD_ICONV_ERROR, and TLD_NODATA.

5.24.3.7   const Tld_table∗ tld_default_table (const char ∗ *tld*, const Tld_table ∗∗ *overrides*)

tld_default_table - get table for a TLD name

Parameters:

> *tld* TLD name (e.g. "com") as zero terminated ASCII byte string.
>
> *overrides* Additional zero terminated array of Tld_table info-structures for TLDs, or NULL to only use library deault tables.

Get the TLD table for a named TLD, using the internal defaults, possibly overrided by the (optional) supplied tables.

Return value: Return structure corresponding to TLD , first looking through then thru built-in list, or NULL if no such structure found.

Definition at line 79 of file tld.c.

References _tld_tables, and tld_get_table().

Referenced by tld_check_4().

5.24.3.8 int tld_get_4 (const uint32_t ∗ *in*, size_t *inlen*, char ∗∗ *out*)

tld_get_4 - extract top level domain part in input Unicode string

Parameters:

> *in* Array of unicode code points to process. Does not need to be zero terminated.
>
> *inlen* Number of unicode code points.
>
> *out* Zero terminated ascii result string pointer.

Isolate the top-level domain of and return it as an ASCII string in .

Return value: Return TLD_SUCCESS on success, or the corresponding Tld_rc error code otherwise.

Definition at line 112 of file tld.c.

References DOTP, TLD_MALLOC_ERROR, TLD_NO_TLD, TLD_NODATA, TLD_SUCCESS, and uint32_t.

Referenced by tld_check_4(), tld_get_4z(), and tld_get_z().

5.24.3.9 int tld_get_4z (const uint32_t ∗ *in*, char ∗∗ *out*)

tld_get_4z - extract top level domain part in input Unicode string

Parameters:

> *in* Zero terminated array of unicode code points to process.
>
> *out* Zero terminated ascii result string pointer.

Isolate the top-level domain of and return it as an ASCII string in .

Return value: Return TLD_SUCCESS on success, or the corresponding Tld_rc error code otherwise.

Definition at line 160 of file tld.c.

References tld_get_4(), TLD_NODATA, and uint32_t.

5.24.3.10 const Tld_table∗ tld_get_table (const char ∗ *tld*, const Tld_table ∗∗ *tables*)

tld_get_table - get table for a TLD name in table

Parameters:

> *tld* TLD name (e.g. "com") as zero terminated ASCII byte string.
>
> *tables* Zero terminated array of Tld_table info-structures for TLDs.

Get the TLD table for a named TLD by searching through the given TLD table array.

Return value: Return structure corresponding to TLD by going thru , or return NULL if no such structure is found.

Definition at line 50 of file tld.c.

References Stringprep_profiles::tables.

Referenced by tld_default_table().

5.24.3.11   int tld_get_z (const char ∗ *in*, char ∗∗ *out*)

tld_get_z - extract top level domain part in input string

Parameters:

> *in* Zero terminated character array to process.
>
> *out* Zero terminated ascii result string pointer.

Isolate the top-level domain of and return it as an ASCII string in . The input string may be UTF-8, ISO-8859-1 or any ASCII compatible character encoding.

Return value: Return TLD_SUCCESS on success, or the corresponding Tld_rc error code otherwise.

Definition at line 186 of file tld.c.

References tld_get_4(), TLD_MALLOC_ERROR, and uint32_t.

5.24.3.12   const char∗ tld_strerror (Tld_rc *rc*)

tld_strerror - return string describing tld error code

Parameters:

> *rc* tld return code

Convert a return code integer to a text string. This string can be used to output a diagnostic message to the user.

TLD_SUCCESS: Successful operation. This value is guaranteed to always be zero, the remaining ones are only guaranteed to hold non-zero values, for logical comparison purposes. TLD_INVALID: Invalid character found. TLD_NODATA: No input data was provided. TLD_MALLOC_ERROR: Error during memory allocation. TLD_ICONV_ERROR: Error during iconv string conversion. TLD_NO_TLD: No top-level domain found in domain string.

Return value: Returns a pointer to a statically allocated string containing a description of the error with the return code .

Definition at line 51 of file strerror-tld.c.

References _, TLD_ICONV_ERROR, TLD_INVALID, TLD_MALLOC_ERROR, TLD_NO_TLD, TLD_NODATA, and TLD_SUCCESS.

- char ∗ stringprep_locale_to_utf8 (const char ∗str)
- char ∗ stringprep_utf8_to_locale (const char ∗str)

5.26.1 Function Documentation

5.26.1.1 char∗ stringprep_convert (const char ∗ *str*, const char ∗ *to_codeset*, const char ∗ *from_codeset*)

stringprep_convert - encode string using new character set

Parameters:

str input zero-terminated string.

to_codeset name of destination character set.

from_codeset name of origin character set, as used by .

Convert the string from one character set to another using the system's iconv() function.

Return value: Returns newly allocated zero-terminated string which is transcoded into to_codeset.

Definition at line 110 of file toutf8.c.

Referenced by stringprep_locale_to_utf8(), and stringprep_utf8_to_locale().

5.26.1.2 const char∗ stringprep_locale_charset (void)

stringprep_locale_charset - return charset used in current locale

Find out current locale charset. The function respect the CHARSET environment variable, but typically uses nl_langinfo(CODESET) when it is supported. It fall back on "ASCII" if CHARSET isn't set and nl_langinfo isn't supported or return anything.

Note that this function return the application's locale's preferred charset (or thread's locale's preffered charset, if your system support thread-specific locales). It does not return what the system may be using. Thus, if you receive data from external sources you cannot in general use this function to guess what charset it is encoded in. Use stringprep_convert from the external representation into the charset returned by this function, to have data in the locale encoding.

Return value: Return the character set used by the current locale. It will never return NULL, but use "ASCII" as a fallback.

Definition at line 79 of file toutf8.c.

Referenced by stringprep_locale_to_utf8(), and stringprep_utf8_to_locale().

5.26.1.3   char ∗ **stringprep_locale_to_utf8 (const char** ∗ *str***)**

stringprep_locale_to_utf8 - convert locale encoded string to UTF-8

Parameters:

> *str* input zero terminated string.

Convert string encoded in the locale's character set into UTF-8 by using stringprep_convert().

Return value: Returns newly allocated zero-terminated string which is transcoded into UTF-8.

Definition at line 137 of file toutf8.c.

References stringprep_convert(), and stringprep_locale_charset().

Referenced by idna_to_ascii_lz(), idna_to_unicode_lzlz(), and tld_check_lz().

5.26.1.4   char ∗ **stringprep_utf8_to_locale (const char** ∗ *str***)**

stringprep_utf8_to_locale - encode UTF-8 string to locale encoding

Parameters:

> *str* input zero terminated string.

Convert string encoded in UTF-8 into the locale's character set by using stringprep_convert().

Return value: Returns newly allocated zero-terminated string which is transcoded into the locale's character set.

Definition at line 153 of file toutf8.c.

References stringprep_convert(), and stringprep_locale_charset().

Referenced by idna_to_unicode_8zlz().

```

Functions

- const char ∗ stringprep_check_version (const char ∗req_version)

5.27.1 Function Documentation

5.27.1.1 const char∗ stringprep_check_version (const char ∗ *req_version*)

stringprep_check_version - check for library version

Parameters:

> ***req_version*** Required version number, or NULL.

Check that the the version of the library is at minimum the requested one and return the version string; return NULL if the condition is not satisfied. If a NULL is passed to this function, no check is done, but the version string is simply returned.

See STRINGPREP_VERSION for a suitable string.

Return value: Version string of run-time library, or NULL if the run-time library does not meet the required version number.

Definition at line 43 of file version.c.
