

NAME

mindi – a tool for creating boot/root disks

SYNOPSIS

```
mindi
mindi -v| --version| -V| -version
mindi --findkernel
mindi --makemountlist file
mindi [-max-compressed-size max] --custom parameters
```

DESCRIPTION

mindi creates a set of boot/root floppy disk images and/or a bootable ISO image using files from the system it runs on. **mindi** will try hard to reproduce the environment of its host system including loaded modules to ensure that the system can be booted properly from the created rescue media. **mindi** is used by **mondoarchive(8)** to produce the required boot/root floppy or CD images but can also be used stand-alone.

For stand-alone usage, **mindi** is called without any parameters or switches. It will then interactively ask the user for all information required to create a set of boot/root media.

The probably more frequent way of calling **mindi** is non-interactively from **mondoarchive(8)** using the **--custom** switch. All required information is then provided via command line parameters. The sequence of these parameters is listed below.

OPTIONS

-v| --version| -V| -version

Prints the version of mindi.

--findkernel

Finds the image of the running kernel in the file system.

--makemountlist *file*

Creates a mount list and writes it to file *file*.

--max-compressed-size *max*

Maximum size for disk image in KB.

--custom *parameters*

Provide all required parameters to **mindi** for non-interactive calling. This usually means a call from **mondoarchive(8)**. The following parameters are used:

- 01) directory to use for temporary files
- 02) directory to put disk images in
- 03) path to kernel image
- 04) tape device
- 05) tape size [MB]
- 06) total number of files in file list
- 07) use LZO [yes|no]
- 08) CD recovery media [yes|no]
- 09) devices to include
- 10) conservative LiLo settings [yes|no]
- 11) number of last file list
- 12) estimated total number of slices
- 13) devices to exclude
- 14) compare mode [yes|no]
- 15) use lilo [yes|no]
- 16) use star (rather than tar) [yes|no]
- 17) internal tape block size [bytes]
- 18) number of differential backup
- 19) make non-bootable [yes|no]

(Blank parameters must be specified as "" on the command line.)

DIAGNOSTICS

mindi writes some output to the console and extensive information to log file */var/log/mindi.log*. When seeking technical support for **mindi**, please attach this file to your email.

FILES

/var/log/mindi.log

Log file of mindi run. Contains important information to analyze mindi problem reports.

/etc/mindi/deplist.txt

List of files to be included on boot/root disks.

/var/cache/mindi/N.tar.gz

Number N of multiple tar balls together containing root file system for rescue media.

/var/cache/mindi/all.tar.gz

Single tar ball of root file system for rescue media.

/var/cache/mindi/initrd.img

initrd image for bootable ISO image.

/var/cache/mindi/mindi-boot.F.img

mindi boot floppy of size F [KB].

/var/cache/mindi/mindi-root.F.img

mindi root floppy of size F [KB].

/var/cache/mindi/mindi-data.N.img

mindi data floppy number N for boot/root floppies.

/var/cache/mindi/mindi.iso

mindi bootable ISO image.

CONFIGURATION FILE

You may create a mindi configuration file under */etc/mindi* called **mindi.conf** which overwrites default values by setting up the following variables:

TMPDIR

(default /tmp): directory to create temporary files

EXTRA_SPACE

(default 24576): increase if you run out of ramdisk space

IA64_BOOT_SIZE

(default 8192): size of the ia64 boot disk

CACHE_LOC

(default /var/cache/mindi): directory where boot/root files and iso are generated

WARNING: This directory is erased before usage
