

Package ‘INLAtools’

December 19, 2025

Type Package

Title Functionalities for the 'INLA' Package

Version 0.0.6

Maintainer Elias Teixeira Krainski <eliaskrainski@gmail.com>

Description Contain code to work with a C struct, in short cgeneric, to define a Gaussian Markov random (GMRF) model. The cgeneric contain code to specify GMRF elements such as the graph and the precision matrix, and also the initial and prior for its parameters, useful for model inference. It can be accessed from a C program and is the recommended way to implement new GMRF models in the 'INLA' package (<<https://www.r-inla.org>>). The 'INLAtools' implement functions to evaluate each one of the model specifications from R. The implemented functionalities leverage the use of 'cgeneric' models and provide a way to debug the code as well to work with the prior for the model parameters and to sample from it. A very useful functionality is the Kronecker product method that creates a new model from multiple cgeneric models. It also works with the rgeneric, the R version of the cgeneric intended to easy try implementation of new GMRF models. The Kronecker between two cgeneric models was used in Sterrantino et. al. (2024) <[doi:10.1007/s10260-025-00788-y](https://doi.org/10.1007/s10260-025-00788-y)>, and can be used to build the spatio-temporal intrinsic interaction models for what the needed constraints are automatically set.

cgeneric-class	<i>Organize data for the latent GMRF C interface for INLA.</i>
----------------	--

Description

A GMRF is defined from model parameters θ that would parametrize a (sparse) precision matrix.
The elements of a GMR are:

- graph to define the non-zero precision matrix pattern. only the upper triangle including the diagonal is needed.
- Q vector where the
 - first element (N) is the size of the matrix,

- second element (M) is the number of non-zero elements in the upper part (including) diagonal
- the remaining (M) elements are the actual precision (upper triangle plus diagonal) elements whose order shall follow the graph definition.
- `mu` the mean vector,
- initial vector with
 - first element as the number of the parameters in the model
 - remaining elements should be the initials for the model parameters.
- `log.norm.const` log of the normalizing constant.
- `log.prior` log of the prior for the model parameters.

Usage

```
cgeneric(model, ...)

## S3 method for class 'character'
cgeneric(model, ...)

## S3 method for class '`function`'
cgeneric(model, ...)

## S3 method for class 'cgeneric'
cgeneric(model, ...)

## S3 method for class 'inla.cgeneric'
cgeneric(model, ...)

cgenericBuilder(...)

cgeneric_shlib(debug, package, useINLAp recomp)
```

Arguments

<code>model</code>	object class for what a <code>cgeneric</code> method exists. E.g., if it is a character, a specific function will be called. E.g. <code>cgeneric("iid", ...)</code> calls <code>cgeneric_iid(...)</code> .
<code>...</code>	arguments passed from the <code>cgeneric()</code> methods. FIIt should include <code>n</code> and <code>debug</code> . For <code>cgenericBuild</code> it should model as a character string with the name of the C function and <code>shlib</code> as the path to the shared object containing such function. If <code>shlib</code> is not provided it can be built using <code>inla_shlib</code> from the arguments, <code>package</code> (character with the R package containing it), <code>useINLAp recomp</code> (logical to indicate if INLA contains it and to use it).
<code>debug</code>	integer, used as verbose in debug.
<code>package</code>	character giving the name of the package that contains the <code>cgeneric</code> model.
<code>useINLAp recomp</code>	logical, indicating if it is to use the shared object previously copied and compiled by INLA.

Value

a method to build a cgeneric should return a named list of cgeneric class that contains a named list f that contains (at least):

- model a character always equal to cgeneric,
- n an integer greater than 0, and
- cgeneric as a named list that contains the data needed to define the model. Each element on ...\$fcgeneric is also a named list containing ints, doubles, characters, matrices and smatrices.
- (possible) extraconstr as a named list with: A as a n times k matrix and e as a length k vector.
- (possible) bm_mapper (TO DO) mapper for inlabru package.

The cgeneric_shlib function returns a character with the path to the shared lib.

Functions

- cgeneric(cgeneric): Returns the model object unchanged.
- cgeneric(inla.cgeneric): Converts a regular inla.cgeneric object to cgeneric.

Note

The graph and Q non-zero pattern should match, its elements should be ordered by row, and only its upper part stored.

cgeneric_generic0	<i>Build an cgeneric object for a generic0 model. See details.</i>
-------------------	--

Description

Build data needed to implement a model whose precision has a conditional precision parameter. This uses the C interface in the 'INLA' package, that can be used as a linear predictor model component with an 'f' term.

Usage

```
cgeneric_generic0(R, param, constr = TRUE, scale = TRUE, ...)
```

```
cgeneric_iid(n, param, constr = FALSE, ...)
```

Arguments

R	the structure matrix for the model definition.
param	length two vector with the parameters a and p for the PC-prior distribution defined from $P(\sigma > a) = p$ where σ can be interpreted as marginal standard deviation of the process if scale = TRUE. See details.
constr	logical indicating if it is to add a sum-to-zero constraint. Default is TRUE.
scale	logical indicating if it is to scale the model. See details.
...	arguments (debug,useINLAprecomp,shlib) passed on to cgeneric() .
n	integer required to specify the model size

Details

The precision matrix is defined as

$$Q = \tau R$$

where the structure matrix R is supplied by the user and τ is the precision parameter. Following Sørbye and Rue (2014), if scale = TRUE the model is scaled so that

$$Q = \tau s R$$

where s is the geometric mean of the diagonal elements of the generalized inverse of R .

$$s = \exp \sum_i \log((R^-)_{ii})/n$$

If the model is scaled, the geometric mean of the marginal variances, the diagonal of Q^{-1} , is one. Therefore, when the model is scaled, τ is the marginal precision, otherwise τ is the conditional precision.

Value

a cgeneric object, see [cgeneric\(\)](#).

Functions

- [cgeneric_iid\(\)](#): The [cgeneric_iid](#) uses the [cgeneric_generic0](#) with the structure matrix as the identity.

References

Sigrunn Holbek Sørbye and Håvard Rue (2014). Scaling intrinsic Gaussian Markov random field priors in spatial modelling. Spatial Statistics, vol. 8, p. 39-51.

See Also

[prior.cgeneric\(\)](#)

Examples

```
## structured precision matrix model definition
R <- Matrix(toeplitz(c(2,-1,0,0,0)))
R
mR <- cgeneric("generic0", R = R,
  param = c(1, 0.05), scale = FALSE)
graph(mR)
prec(mR, theta = 0)
```

cgeneric_get	<i>cgeneric_get is an internal function used by graph, pred, initial, mu or prior methods for cgeneric.</i>
--------------	---

Description

The `cgeneric_get` retrieve a model property specified by `cmd` on an `cgeneric` object. The functions listed below are for each `cmd` case.

Usage

```
cgeneric_get(
  model,
  cmd = c("graph", "Q", "initial", "mu", "log_prior"),
  theta,
  optimize = TRUE
)

## S3 method for class 'cgeneric'
initial(model)

## S3 method for class 'cgeneric'
mu(model, theta)

## S3 method for class 'cgeneric'
graph(model, optimize)

## S3 method for class 'cgeneric'
prec(model, theta, optimize)

## S3 method for class 'cgeneric'
prior(model, theta)
```

Arguments

<code>model</code>	a <code>cgeneric</code> object.
<code>cmd</code>	an string to specify which model element to get

theta	numeric vector with the model parameters. If missing, the <code>initial()</code> will be used.
optimize	logical indicating if it is to be returned only the elements and not as a sparse matrix.

Value

depends on cmd

numeric scalar (if numeric vector is provided for theta) or vector (if numeric matrix is provided for theta).

Functions

- `initial(cgeneric)`: Retrive the initial parameter(s) of an cgeneric model.
- `mu(cgeneric)`: Evaluate the mean for an cgeneric model.
- `graph(cgeneric)`: Retrieve the graph of an cgeneric object
- `prec(cgeneric)`: Retrieve the precision of an cgeneric object
- `prior(cgeneric)`: Evaluate the prior for an cgeneric model

Examples

```
old.par <- par(no.readonly = TRUE)

## Setting the prior parameters
prior.par <- c(1, 0.5) # P(sigma > 1) = 0.5
cmodel <- cgeneric(
  model = "iid", n = 10,
  param = prior.par)

## prior summaries: sigma and log-precision
(lamb <- -log(prior.par[2])/prior.par[1])
(smedian <- qexp(0.5, lamb))
(smean <- 1/lamb)

## mode: at the minimum of - log-prior
(lpmode <- optimize(function(x)
  -prior(cmodel, theta = x),
  c(-10, 30))$minimum)
## mean: integral of x*f(x)dx
(lpmean <- integrate(function(x)
  exp(prior(cmodel, theta = matrix(x, 1)))*x,
  -10, 30)$value)

## prior visualization: log(precision) and sigma
par(mfrow = c(1, 2))
plot(function(x)
```

```

exp(prior(cmodel, theta = matrix(x, nrow=1))),
  -3, 3, n = 601, xlab = "log-precision",
  ylab = "density")
abline(v = lpmode, lwd = 3, col = 2)
rug(-2*log(smedian), lwd = 3, col = 3)
rug(lpmean, lwd = 3, col = 4)
plot(function(x)
  exp(prior(cmodel,
    theta = matrix(
      -2*log(x),
      nrow = 1))+log(2)-log(x)),
    1/100, 10, n = 1000,
    xlab = expression(sigma),
    ylab = "density")
  plot(function(x) dexp(x, lamb),
    1/100, 10, n = 1000,
    add = TRUE, lty = 2, col = 2)
  rug(smedian, lwd = 3, col = 3)
  rug(smean, lwd = 3, col = 4)

par(old.par)

```

extraconstr	<i>Kronecker (product) between extraconstr, implemented for kronecker() methods.</i>
-------------	--

Description

Kronecker (product) between extraconstr, implemented for [kronecker\(\)](#) methods.

Usage

```
kronecker_extraconstr(c1, c2, n1, n2)
```

Arguments

c1, c2	named list with two elements: A and e, where nrow(A) should be equal to length(e). These are constraint definitions.
n1, n2	integer with each model's length.

Value

The constraint definition for the whole latent model built from the Kronecker product. A length two named list. 'A' a matrix and 'e' a vector where nrow(A)=length(e) and ncol(A)=(n1*n2).

findGetFunction	<i>Search a function and retrieve it.</i>
-----------------	---

Description

Search a function and retrieve it.

Usage

```
findGetFunction(fName, package, debug = FALSE)
```

Arguments

fName	character with the name of the function
package	character with the package name
debug	logical indicating if it is to print intermediate progress finding

Details

if 'missing(package)' it will search on the loaded packages, first in the exported functions, and then among the non-exported ones. NOTE: 'package' can include any installed package, see [installed.packages\(\)](#)

Value

function. The (first) package name where it was found is returned as an attribute named "package"

inla.cgeneric.sample	<i>Draw samples from hyperparameters of a cgeneric model component from an inla output, like inla::inla.iidkd.sample().</i>
----------------------	---

Description

Draw samples from hyperparameters of a cgeneric model component from an inla output, like inla::inla.iidkd.sample().

Usage

```
inla.cgeneric.sample(
  n = 10000,
  result,
  name,
  model,
  from.theta,
  simplify = FALSE
)
```

Arguments

n	integer as the sample size.
result	an inla output.
name	character with the name of the model component in the set of random effects.
model	a cgeneric model
from.theta	a function to convert from theta to the desired output for each sample.
simplify	logical (see ?sapply).

Value

matrix (if $n > 1$ and $\text{length}(\text{from.theta}) > 1$) or numeric vector otherwise.

See Also

[prior.cgeneric\(\)](#)

is.zero	<i>Define the is.zero method</i>
---------	----------------------------------

Description

Define the is.zero method

Usage

```
is.zero(x, tol)

## Default S3 method:
is.zero(x, tol)

## S3 method for class 'matrix'
is.zero(x, tol)

## S3 method for class 'Matrix'
is.zero(x, tol)
```

Arguments

x	an R object
tol	numeric to be used as (absolute) tolerance. if missing (default) it will consider $x = 0$.

Value

logical

Methods (by class)

- `is.zero(default)`: The `is.zero.default` definition
- `is.zero(matrix)`: The `is.zero.matrix` definition
- `is.zero(Matrix)`: The `is.zero.Matrix` definition

kronecker	<i>Kronecker (product) between cgeneric/rgeneric models, implemented as kronecker() methods.</i>
-----------	--

Description

Kronecker (product) between cgeneric/rgeneric models, implemented as [kronecker\(\)](#) methods.

Usage

```
## S4 method for signature 'cgeneric,cgeneric'
kronecker(X, Y, FUN = "*", make.dimnames = FALSE, ...)

## S4 method for signature 'cgeneric,rgeneric'
kronecker(X, Y, FUN = "*", make.dimnames = FALSE, ...)

## S4 method for signature 'rgeneric,cgeneric'
kronecker(X, Y, FUN = "*", make.dimnames = FALSE, ...)

## S4 method for signature 'rgeneric,rgeneric'
kronecker(X, Y, FUN = "*", make.dimnames = FALSE, ...)
```

Arguments

X	cgeneric or rgeneric
Y	cgeneric or rgeneric
FUN	see kronecker()
make.dimnames	see kronecker()
...	see kronecker()

Value

if 'X' and 'Y' are cgeneric return a cgeneric, else a rgeneric.

Examples

```
R <- Matrix(crossprod(diff(diag(4))))
m1 <- cgeneric("generic0", R = R, param = c(1, NA),
  scale = FALSE, useINLApcomp = FALSE)
m2 <- cgeneric("iid", n = 3, param = c(1, 0.5),
  useINLApcomp = FALSE)
k21 <- kronecker(m2, m1, useINLApcomp = FALSE)
prec(k21, theta = 0.0)
```

 methods

Methods to work with a model.

Description

For a given model object query the initial, mu, log prior, graph or precision prec can be evaluated/retrieved.

Usage

```
initial(model)

mu(model, theta)

prior(model, theta)

graph(model, optimize)

prec(model, theta, optimize)

## Default S3 method:
prec(model, ...)

## S4 method for signature 'Matrix'
vcov(object, ...)

## S3 method for class 'inla'
prec(model, ...)
```

Arguments

model	object to represent a model
theta	numeric vector. For prior it can be a numeric matrix, with number of lines equal the size of theta and each column as a different case.
optimize	logical indicating if it is to be returned only the elements and not as a sparse matrix.
...	additional arguments passed on
object	Matrix supposed to be a sparse precision matrix

Value

the result of the desired query of the 'cgeneric' model. 'graph' and 'prec' can be either a vector (if optimize = TRUE) or a sparse matrix.

Functions

- `initial()`: Retrieve the initial model parameter(s)
- `mu()`: Evaluate the model's mean
- `prior()`: Evaluate the log-prior for a given theta
- `graph()`: Retrieve the models' graph
- `prec()`: Retrieve the precision for a given theta
- `prec(default)`: The default precision method computes the inverse of the variance
- `vcov(Matrix)`: The vcov method for sparse matrices
- `prec(inla)`: Define the prec method for an inla output object

See Also

[prior.cgeneric\(\)](#)

multi_generic_model	<i>Combine two or more cgeneric or rgeneric models</i>
---------------------	--

Description

Constructs a multiple kronecker product model from a list of model objects. The resulting model contains a corresponding `inlabru::bm_multi()` mapper. This can be used as an alternative to a binary tree of kronecker product models.

Usage

```
multi_generic_model(models, ...)
```

Arguments

<code>models</code>	A list of cgeneric or rgeneric models, optionally with names
<code>...</code>	Arguments passed on to every <code>kronecker()</code> call.

Details

The last model in the list has the slowest index variation, and the first model has the fastest index variation. This matches the latent variable ordering of standard INLA: `f()` model components with (main, group, replicate).

Value

A 'cgeneric' or 'rgeneric' model object, containing a multi-kronecker product model, with a corresponding `inlabru::bm_multi()` mapper.

Examples

```

R1 <- Matrix(crossprod(diff(diag(4))))
m1 <- cgeneric("generic0", R = R1, param = c(1, NA),
  scale = FALSE, useINLAprecomp = FALSE)
R2 <- Matrix(crossprod(diff(diag(3))))
m2 <- cgeneric("generic0", R = R2, param = c(1, NA),
  scale = FALSE, useINLAprecomp = FALSE)
m3 <- cgeneric("iid", n = 2, param = c(1, 0.5),
  useINLAprecomp = FALSE)
multi123 <- multi_generic_model(
  list(m1 = m1, m2 = m2, m3 = m3),
  useINLAprecomp = FALSE
)
prec(multi123, theta = 0.0)
if(!is.na(packageCheck("inlabru", "2.13.0.9005"))){
  print(multi123$mapper)
}

```

packageCheck

To check package version and load

Description

To check package version and load

Usage

```
packageCheck(name, minimum_version, quietly = FALSE)
```

Arguments

name	character with the name of the package
minimum_version	character with the minimum required version
quietly	logical indicating if messages shall be printed

Note

Original in inlabru package function `check_package_version_and_load`

rgeneric-class	<i>Organize data for the latent GMRF R interface for INLA.</i>
----------------	--

Description

Organize data for the latent GMRF R interface for INLA.

The rgeneric default method.

Usage

```
rgeneric(model, debug = FALSE, compile = TRUE, optimize = TRUE, ...)
```

```
## Default S3 method:
```

```
rgeneric(model, debug = FALSE, compile = TRUE, optimize = TRUE, ...)
```

```
## S3 method for class 'rgeneric'
```

```
rgeneric(model, ...)
```

```
## S3 method for class 'inla.rgeneric'
```

```
rgeneric(model, ...)
```

```
## S3 method for class 'rgeneric'
```

```
graph(model, ...)
```

```
## S3 method for class 'rgeneric'
```

```
prec(model, ...)
```

```
## S3 method for class 'rgeneric'
```

```
initial(model)
```

```
## S3 method for class 'rgeneric'
```

```
mu(model, theta)
```

```
## S3 method for class 'rgeneric'
```

```
prior(model, theta)
```

Arguments

model	a rgeneric model object
debug	logical indicating debug state.
compile	logical indicating to compile the model.
optimize	logical indicating if only the elements of the precision matrix are returned.
...	additional parameter such as 'theta' If 'theta' is not supplied, initial will be taken.
theta	the parameter.

Value

`rgeneric/ inla.rgeneric` object.

Functions

- `rgeneric(rgeneric)`: Returns the model object unchanged.
- `rgeneric(inla.rgeneric)`: Converts a regular `inla.rgeneric` object to `rgeneric`.
- `graph(rgeneric)`: The graph method for 'rgeneric'
- `prec(rgeneric)`: The precision method for an `rgeneric` object.
- `initial(rgeneric)`: The initial method for 'rgeneric'
- `mu(rgeneric)`: The mu method for 'rgeneric'
- `prior(rgeneric)`: The prior metho for 'rgeneric'

Sparse	<i>To store in i,j,x sparse matrix format</i>
--------	---

Description

To store in i,j,x sparse matrix format

Usage

```
Sparse(A, unique = TRUE, na.rm = FALSE, zeros.rm = FALSE)
```

Arguments

<code>A</code>	matrix or Matrix
<code>unique</code>	logical (default is TRUE) to ensure that the internal representation is unique and there are no duplicated entries. (Do not change this unless you know what you are doing.)
<code>na.rm</code>	logical (default is FALSE) indicating if it is to replace 'NA's in the matrix with zeros.
<code>zeros.rm</code>	logical (default is FALSE) indicating if it is to remove zeros in the matrix. Applied after <code>na.rm</code> .

Note

This is based in `INLA::inla.as.sparse()`, but allow all combinations of 'na.rm' and 'zeros.rm'.

upperPadding	<i>Padding (a list of) sparse matrices.</i>
--------------	---

Description

Padding (a list of) sparse matrices.

Usage

```
upperPadding(M, relative = FALSE, ...)
```

Arguments

M	'Matrix' (or a list of them).
relative	logical. If 'M' is a list, it indicates if it is to be returned a relative index and the value for each matrix. See details.
...	additional arguments passed to Sparse .

Details

This is useful to prepare a matrix, or a list of, sparse matrices for use in some 'cgeneric' code.

Define a graph of the union of the supplied matrices and return the row ordered diagonal plus upper triangle after padding with zeroes each one so that all the returned matrices have the same pattern.

If relative=FALSE, each columns of 'xx' is the elements of the corresponding matrix after being padded to fill the pattern of the union graph. If relative=TRUE, each element of 'xx' would be a list with a relative index, 'r', for each non-zero elements of each matrix is returned relative to the union graph, the non-lower elements, 'x', of the corresponding matrix, and a vector, 'o', with the number of non-zero elements for each line of each resulting matrix.

Value

If a unique matrix is given, return the upper triangle considering the 'T' representation in the dgTMatrix, from the Matrix package. If a list of matrices is given, return a list of two elements: 'graph' and 'xx'. The 'graph' is the union of the graph from each matrix. If relative=FALSE, 'xx' is a matrix with number of column equals the the number of matrices imputed. If relative=TRUE, it is a list of length equal the number of matrices imputed. See details.

Examples

```
A <- sparseMatrix(
  i = c(1, 1, 2, 3, 3, 5),
  j = c(2, 5, 3, 4, 5, 5),
  x = -c(0:3, NA, 1), symmetric = TRUE)
A
upperPadding(A)
upperPadding(A, na.rm = TRUE)
upperPadding(A, zeros.rm = TRUE)
```

```
upperPadding(A, na.rm = TRUE, zeros.rm = TRUE)
B <- Diagonal(nrow(A), -colSums(A, na.rm = TRUE))
B
upperPadding(list(a = A, b = B), na.rm = TRUE, zeros.rm = TRUE)
upperPadding(list(a = A, b = B), relative = TRUE)
```
