Type Package

Title Cause-Deleted Life Expectancy Improvement Procedure

Version 1.0

Date 2020-01-24

Author Peter Adamic, Alicja Wolny-Dominiak

Maintainer Alicja Wolny-Dominiak <woali@ue.katowice.pl>

Description

The concept of cause-deleted life expectancy improvement is statistic designed to quantify the increase in life expectancy if a certain cause of death is removed. See Adamic, P. (2015) (<https://papers.ssrn.com/sol3/papers.cfm?abstract_id=2689352>).

cdlei *The life expectancy improvement with a cure distribution for a cause of death.*

Description

In may circumstances, to increase in life expectancy when a certain cause of death is eliminated is sought, but this is usually done by taking the cause out of consideration fully, which is unrealistic. Here, we incorporate a probability distribution for the cure of the cause over time, to more accurately predict the increase in life expectancy at each age.

Usage

```
cdlei(age, qtau, qhiv, k, d)
```

Arguments

age	age
qtau	vector of probabilities of death by all causes at each age
qhiv	vector of probabilities of death by HIV at each age
k	cure probability parameter
d	index

Value

cdlei	cause-deleted life expectancy
qx	probability of deatch at age x
px	probability of survival at age x
tpx	probability an x year old survives to age x+t
sumtpx	sum of tpx
Fk	probability of curve
pxx	probability of survival at age x, using cure probability
tpxx	probability of sirviving t years after age x, using cure probability
sumtpxx	cumulative sum of tpx
df	data frame

Examples

```
data(lifeData)
res <- cdlei(lifeData$age, lifeData$qtau, lifeData$qhiv, 0.02, 100000)
str(res)
res$cdlei
```

Fk *Curve Probability function*

Description

A simple discrete-time function accounting for the probability that HIV will be cured by time t. Assume the curve function begins at age 0.

Usage

```
Fk(age, k)
```

Arguments

age	age of person
k	cure probability parameter

Value

Fk	curve probability function

Examples

```
data(lifeData)
Fk(lifeData$age, 0.02)
```

---

lifeData *HIV-related deaths from Colorado, USA, between 2000-2012.*

Description

Input data matrix consists of the probabilities of death from all causes, and by HIV only, for ages 0 to 103 (inclusive).

Usage

```
data("lifeData")
```

Format

A data frame with 104 observations on the following 3 variables.

`age` a numeric vector

`qtau` a numeric vector

`qhiv` a numeric vector

Source

Data source: Colorado Department of Public Health and Environment.

Examples

```
data(lifeData)
str(lifeData)
```
